

Productivity statistics

Years 1995-2017

Istat releases productivity statistics for the period 1995-2017. The productivity series are coherent with the results of the latest release of national accounts.

The adopted methodology closely follows the approach outlined in the OECD Manual on Productivity Measurement. Productivity is defined as the ratio of a volume measure of output to a volume measure of input. Both single factor productivity measures (relating a measure of output to a single measure of input) and multifactor productivity measures (relating a measure of output to a bundle of inputs) are estimated.

Output is the chain linked value added at basic prices. Labour input is measured as total hours worked by all persons engaged in production (both employees and self-employed). Capital input is measured as the volume of capital services provided by the stocks of three categories of ICT assets (hardware, communication equipment and computer software), eight categories of tangible non-ICT assets (non-ICT machinery and equipment, furniture, road transport equipment, other transport equipment, livestock, tree and plant resources, construction works, and costs of ownership transfer) and three categories of intangible non-ICT assets (research and development, entertainment, artistic and literary originals, and mineral explorations).

Productivity measures are estimated using national accounts data released in accordance with NACE Rev.2 classification. Estimates are provided for 38 industries (and their aggregation in 21, 10 and 3 groups of activities) as well as for the total economy. Both industry level and aggregate estimates are calculated net of real estate activities, of activities of households, of activities of extraterritorial organizations and of all activities of the General government sector. In the benchmark year 2011 the total of the above defined sectors accounted for 70.4% of total value added and 83.0% of total hours worked.

Labour productivity in the measured sectors increased by 0.8.% in 2017, as value added grew by 2.1% and hours worked went up by 1.3%. In the same year capital productivity rose by 1.2%, as capital input and multifactor productivity grew respectively by 0.9% and 1.0%.

The increase in labour productivity in 2017 was accounted for by a fall in capital deepening (i.e. a reduction of capital input relative to labour input) which contributed for -0.2 percentage points, with total factor productivity contributing for +1.0 percentage point.

Over the whole period 1995-2017, average annual growth rate in value added was 0.7%. Labour productivity rose by 0.4% due to labour input (+0.3%) increasing less than value added. In the same period capital input (+1.4%) and the combined inputs of capital and labour (0.7%) rose more than value added and capital productivity fell (-0.7%).

The growth in labour productivity in 1995-2017 was driven only by capital deepening, which contributed for +0.4 percentage points per year, with total factor productivity bringing in average no contribution. Tangible non-ICT capital contributed 0.2 percentage points, while ICT capital (i.e computer hardware, communications equipment and computer software) and intangible non-ICT capital contributed both for 0.1 percentage points in terms of yearly average.

Over the last cycle (2009-2015) value added decreased by 0.1% on yearly average. Labour productivity, capital productivity and total factor productivity all rose (respectively by +0.8%, +0.5% and +0.7% per year) due to hours worked, capital input and the combined inputs of capital and labour all decreasing more than value added (respectively -0.9%, -0.5% and -0.8%).

The growth in labour productivity in 2009-2015 was mainly driven by total factor productivity, which contributed +0.7 percentage points, with capital deepening contributing for +0.1 percentage points.

FIGURE 1. LABOUR PRODUCTIVITY, VALUE ADDED AND HOURS WORKED. TOTAL ECONOMY (a).
Years 1995-2017, index 2010 = 100

(a) Net of real estate activities, of activities of households, of activities of extraterritorial organizations and of all activities of the General government sector.

FIGURE 2. TOTAL FACTOR PRODUCTIVITY, VALUE ADDED AND COMBINED INPUTS. TOTAL ECONOMY (a).
Years 1995-2017, index 2010 = 100

(a) Net of real estate activities, of activities of households, of activities of extraterritorial organizations and of all activities of the General government sector.

TABLE 1. VALUE ADDED, INPUTS AND PRODUCTIVITY STATISTICS. TOTAL ECONOMY (a).
Years 1995-2017, compound average annual rates of growth

	Value added	Inputs			Productivity statistics		
		Hours worked	Capital input	Combined inputs	Labour productivity	Capital productivity	Multifactor productivity
1995-2017	0.7	0.3	1.4	0.7	0.4	-0.7	0.0
2003-2015	-0.1	-0.4	0.6	-0.1	0.3	-0.7	-0.1
2003-2009	-0.2	0.1	1.7	0.6	-0.3	-1.8	-0.9
2009-2015	-0.1	-0.9	-0.5	-0.8	0.8	0.5	0.7
2016	1.9	1.9	0.3	1.4	-0.1	1.6	0.5
2017	2.1	1.3	0.9	1.1	0.8	1.2	1.0

(a) Net of real estate activities, of activities of households, of activities of extraterritorial organizations and of all activities of the General government sector

TABLE 2. CONTRIBUTIONS TO LABOUR PRODUCTIVITY GROWTH. TOTAL ECONOMY (a).
Years 1995-2017, compound average annual rates of growth and percentage points

Labour productivity	Contributions to labour productivity growth (percentage points)					Multifactor productivity
	Capital input per hour worked	ICT capital input per hour worked	Tangible non-ICT capital input per hour worked	Intangible non-ICT capital input per hour worked		
1995-2017	0.4	0.4	0.1	0.2	0.1	0.0
2003-2015	0.3	0.3	0.0	0.2	0.0	-0.1
2003-2009	-0.3	0.5	0.0	0.5	0.0	-0.9
2009-2015	0.8	0.1	0.1	0.0	0.0	0.7
2016	-0.1	-0.5	0.1	-0.7	0.0	0.5
2017	0.8	-0.2	0.1	-0.3	0.1	1.0

(a) Net of real estate activities, of activities of households, of activities of extraterritorial organizations and of all activities of the General government sector .
