

January 2023

INDUSTRIAL PRODUCTION

- The index measures the monthly evolution of the volume of industrial production (excluding construction). From January 2022 the indices are calculated as annual chain-linked indices instead of fixed base indices. The weighting reference is now year 2022 while the reference base is still the year 2015. Indices are produced according to Ateco 2007 classification (Italian edition of Nace Rev. 2).
- In January 2023 the seasonally adjusted industrial production index decreased by 0.7% compared with the previous month. The change of the average of the last three months with respect to the previous three months was -1.0%.
- The calendar adjusted industrial production index increased by 1.4% compared with January 2022 (calendar working days being 21 versus 20 days in January 2022).
- The unadjusted industrial production index increased by 4.5% compared with January 2022.

CHART 1. INDUSTRIAL PRODUCTION, SEASONALLY ADJUSTED INDEX AND THREE-MONTH MOVING AVERAGE
 January 2018 – January 2023 (index, 2015=100)

CHART 2. INDUSTRIAL PRODUCTION, MONTH ON SAME MONTH A YEAR AGO PERCENTAGE CHANGES

January 2019 – January 2023, calendar adjusted data (index, 2015=100)

TABLE 1. INDUSTRIAL PRODUCTION INDICES (a), MONTHS ON PREVIOUS MONTHS AND ON SAME MONTHS A YEAR AGO PERCENTAGE CHANGES

January 2023 (b) (index, 2015=100)

INDICES	Index (2015=100)	Months on previous months		Months on same months a year ago
		Jan 23 Dec 22	Nov 22-Jan 23 Aug 22-Oct 22	Jan 23 Jan 22
		Industrial production seasonally adjusted	103.9	-0.7
Industrial production calendar adjusted	97.4	-	-	+1.4
Industrial production non – seasonally adjusted	97.9	-	-	+4.5
Calendar working days	21			

(a) Excluding construction.

(b) Data are provisional and subject to revisions. The first revision takes place with the dissemination of the following month and takes into account additional information received from enterprises. Since 2022 data undergo also an annual revision of the previous year.

CHART 3. YEAR-ON-YEAR GROWTH RATE BY INDUSTRIAL GROUPINGS

January 2023, calendar adjusted (index, 2015=100)

Table 2 shows the results of the annual revision carried out with reference to the year 2022, aiming at improving the quality of already published estimates on the basis of additional information received from enterprises and the update of the productivity coefficients for sectors whose production is estimated on the basis of hours worked. For the year 2022 the annual rate of change of the calendar adjusted total industrial production index has been revised downward by 0.1 percentage points (from +0.5% to +0.4%).

TABLE 2. INDUSTRIAL PRODUCTION BY MAIN INDUSTRIAL GROUPINGS CALENDAR ADJUSTED DATA COMPARISON BETWEEN PREVIOUSLY RELEASED DATA AND REVISED DATA.

Percentage changes compared to corresponding period (base 2015=100)

YEARS	Industrial Production Index		Durable consumer goods		Non-durable consumer goods		Capital goods		Intermediate goods		Energy	
	Previously released data	Revised data	Previously released data	Revised data	Previously released data a	Revised data	Previously released data	Revised data	Previously released data	Revised data	Previously released data	Revised data
2022	+0.5	+0.4	+2.7	+2.2	+3.7	+3.5	+1.5	+1.8	-2.3	-2.4	-1.3	-1.3

Consumer durables: examples of consumer durables include household appliances, furniture, motorcycles and audio and video equipment.

Consumer non-durables: examples of consumer non-durables include food and beverages processing and preservation, several kinds of textile manufacturing and pharmaceutical manufacturing.

Intermediate goods: examples of intermediate goods include chemical industry, metal fabrication, metal products and electrical appliances manufacturing, wood industry and textiles processing.

Capital goods: examples include production of machinery and manufacturing equipment, measuring and test equipment and vehicles.

Survey sample: subset of statistical units selected from a larger population in order to conduct a survey. In short-term statistics, a theoretical sample is defined when rebasing the indices every five years to obtain longitudinal or panel data, considering the actual corporate changes over time.

Calendar adjusted data: calendar adjusted data refer to the correction for calendar effect in a reference period (month or quarter) that may vary from year to year. This method allows a reconciliation of asymmetries for calendar differences such as the number of working days, the week days distribution in the reference period and the occurrence of public holidays (including moving holidays like Easter) and of a leap year. Working day adjusted data permit to better compare year-on-year growth rate and average annual growth rate.

Seasonal adjusted data: seasonal adjusted data refer to the statistical technique designed to remove fluctuations related to seasonal factors (such as weather conditions, administrative measures, etc....) and calendar effects when relevant. Seasonal adjustment provides a clearer view for a trend analysis of a short-term index.

Energy: examples of energy industries include extraction of raw materials (petroleum, natural gas, coal) and refining processes and electricity, gas, steam and air conditioning supply.

Working days: calendar days of the month, not including Saturdays, Sundays, religious and secular public holidays.

Industrial production index: industrial production index measures the monthly evolution of physical volume of production made by industrial establishments (excluding construction).

Main industrial groupings: consumer durables, consumer non-durables, intermediate goods and energy. Commission Regulation (EC) No 656/2007 defines, for the whole European Community, the Main Industrial Groupings (MIGS): each industrial group and industrial activity division head to a different category of this aggregate classification. Istat also releases the Consumer Goods Index, calculated as the weighted average of the durable and non-durable components.

Economic activities sections: according to classification [ANA/ISIC A38](#). The statistical classification of economic activities in the European Community ([NACE Rev. 2](#)) – from which Ateco classification derives – do not include subsections in the structure of the aggregates.

Month on month growth rate: short-term growth rate compares a period (typically a month or quarter) with the previous period, measuring the percentage change.

Year-on-year growth rate: Y-o-Y compares a period (typically a month or quarter) with the same period from the previous year, measuring the percentage change.

Sources and Regulatory framework

The industrial production index measures the change of the volume of goods produced over time by industry (excluding construction).

The legal basis for the STS indicators are the [Regulation \(EU\) 2019/2152](#) of the European Parliament and of the Council on European business statistics, repealing 10 legal acts in the field of business statistics (EBS-Regulation) and the Commission Implementing [Regulation 2020/1197](#) laying down technical specifications and arrangements pursuant to Regulation (EU) 2019/2152 (General Implementing Act).

The survey is provided by the current National Statistical Programme in force, accessible on the Istat internet site at <https://www.istat.it/it/istituto-nazionale-di-statistica/organizzazione/normativa> (Italian only).

Population, analysis and survey units

The industrial production index is based on the results of a sample statistical survey, conducted among enterprises (survey units), that measures the volume of production of the goods included in a representative basket of products (analysis units). This allows the calculation of indices for product line items that, in turn, are grouped by business activity according to the Laspeyres formula and using a weighting structure that reflects the sector distribution of the industrial value added in the year set as the reference period, which now is 2022.

The reference list for identification of the enterprises that take part in the sample is made up from the Statistical Archive of Active Companies (Asia), while the selection is made upon the results of the annual PRODCOM¹ survey.

Survey design and data collection

The monthly survey of industrial production is conducted directly on a panel of approximately 5,400 companies, which provides the data concerning less 9,800 monthly production flows, generally defined in terms of physical quantity. Further statistical sources are used for the estimating production trends of specific industrial sectors. Amongst others, the survey on livestock slaughtered for red and white meat, conducted by Istat; the information provided by the National Offices for Mineral Resources, Hydrocarbons and Geothermal Energy of the Ministry of Enterprise and Made in Italy (MIMIT, ex Productive Activities); the data of electrical energy production surveyed by TERNA (National Electric Network).

For the purposes of maintaining the significance of the index and in order to consider potential changes in quality of industrial products over time, the survey requests the amount of hours worked for specific products (whose weight within total index is 13.5%); the elementary indices of products are then calculated using coefficients of productivity estimated using aggregates of short-term statistics (turnover index and hours worked). Moreover, for a minor number of products (whose weight within total index is 10,1%), the survey requests value of production, purposely deflated with producer price indices.

Indicators, weighting structures and classification systems

Starting from 9th March 2022, indices of industrial production are calculated using the annual chain-linking method; for reporting period January 2022 onward, year 2021 is set as the weighting reference period and 2015 is set as the reference year. Also the 2023 indices are calculated using the chaining method. The innovations introduced concern: the updating of the sample of companies used in the survey, the revision of the weighting system, the updating of the basket of goods. Further information are available in two the methodological notes: the first published on 9 March 2022, the second attached to this bulletin (both only available in Italian). Indices regarding earlier periods (January 2015 – December 2021) are still built using 2015 as a fixed base reference year, following the methodology illustrated in the detailed briefing note: “Il nuovo indice della produzione industriale in base 2015” of 19 March 2018 (only available in Italian).

The index is built according to Ateco 2007 classification of economic activities, the Italian version of Nace Rev. 2. To ensure the compliance with the European short-term statistics regulation (Council Regulation 1165/98), the reference base year for IPI is presently 2015; this change is part of the process of reference bases redefinition that

¹ Annual survey of industrial production

took place in all European countries in 2018.

The adoption of the 2022 bases was the occasion to review the panel of survey products. Specifically, 12 products were eliminated, while another 15 were merged resulting in the creation of five new products and related macro-products, so as to have greater homogeneity with the ProdCom classification. Finally, seven new products were introduced which merge into six new macro-products. With the transition to the 2022 calculation basis, the previous basket of 614 items (macro-products) of the 2021 base changed: against eleven macro-products entered, they were removed 15.

The survey therefore allows to elaborate production indices for 610 items of products which are aggregated in order to compile indices at a higher level of aggregation: Industrial production for each economic activity (according to the classification of economic activities Ateco 2007), Industrial production general index and Industrial production for Main Industrial Groupings (MIGS), as defined by [Commission Regulation No. 656/2007](#) (Official Journal of the European Community of 14 June 2007).

The Main Industrial Groupings are: consumer durable goods, consumer non-durable goods, capital goods, intermediate goods and energy.

The Community Regulation has determined, for all Member Countries, the criteria for the definition of MIGS: entire groups and/or divisions of economic activity are assigned to different groupings according to the prevailing criteria. Istat also publishes the Consumer Goods Index, obtained as the weighted average of the consumer durable goods and consumer non-durable goods indices.

The following table shows the weights, allocated within the weighting system used for the calculation of the industrial production index, the Main Industrial Groupings and the economic activity sectors.

TABLE 1. WEIGHTING STRUCTURE BY ECONOMIC ACTIVITY

Reference year 2021, percentage values

Main Industrial Groupings		Year 2022
Consumer goods		26,0711
<i>Consumer durable goods</i>		3,9283
<i>Consumer non-durable goods</i>		22,1429
Capital goods		29,2581
Intermediate goods		33,1939
Energy		11,4769
Economic activity sectors		
B	Mining and quarrying	1,0838
C	Manufacturing	88,8599
CA	Manufacture of food products, beverages and tobacco products	9,9691
CB	Manufacture of textiles, apparel, leather and accessories	8,0263
CC	Manufacture of wood and paper products, and printing	4,9059
CD	Manufacture of coke and refined petroleum products	0,8742
CE	Manufacture of chemicals and chemical products	4,1400
CF	Manufacture of basic pharmaceutical products and pharmaceutical preparations	3,4632
CG	Manufacture of rubber and plastic products and other non-metallic mineral products	8,1315
CH	Manufacture of basic metals and fabricated metal products, except machinery and equipment	14,3533
CI	Manufacture of computer, electronic and optical products	2,7758
CJ	Manufacture of electrical equipment and of non-electric domestic appliances	3,8657
CK	Manufacture of machinery and equipment n.e.c.	13,5530
CL	Manufacture of transport equipment	7,2590
CM	Other manufacturing, and repair and installation of machinery and equipment	7,5429
D	Electricity, gas, steam and air conditioning supply	10,0564
General index		100.0000

Seasonally and calendar adjusted series

In addition to the raw indices, calendar adjusted time series are also released. In accordance with the guidelines on

seasonal adjustment for the European Statistical System, time series are corrected using a regression model (through the TRAMO procedure - LINUX version), which identifies the effect of the working days (calendar days of the month excluding Saturdays, Sundays and secular and religious holidays not coinciding with Saturdays and Sundays), the leap years and Easter through the introduction of a set of regressors in the univariate model that describes the trend of the series. Since the effect due to the working days is not a zero mean value on an annual basis, the calendar adjusted series calculated through this method would not present an average of 100 for the reference base year (2015 in this case). To release a set of indices with a common base and therefore allowing Eurostat to estimate the European aggregates, the adjusted time series are reported on a base of 2015=100 through a redistribution that maintains the dynamic profile unchanged. Moreover, regressors method results in the revision of the data, since each new monthly information added to the series may require new estimates of the regression parameters.

Given an equal number of working days, the procedures here described may cause discrepancies between y-o-y growth rate calculated on the raw time series and y-o-y growth rate calculated on adjusted data. Negligible differences may be determined from the redistribution and from the subsequent rounding; more relevant differences are due to the effects of the leap year and Easter², and to the type of model used for the correction of the calendar effects. In the case of the additive model, in fact, the differences are inversely proportional to the level of the indices and directly proportional to the absolute value of the trend variations calculated on the raw series.

Following a quality review, from August 2018 onwards new models for estimating calendar and seasonal effects at ATECO levels are adopted. Consistently with the previous rebasing procedure, to overcome the widespread problems of model instability due to the 2008-2009 economic crisis, the time series were made shorter, beginning January 2001, and the indices concerning the 1990-2000 period will not be subject to further modifications.

Finally, the seasonally adjusted indices are obtained through the TRAMO-SEATS procedure (LINUX version). Like the other seasonal adjustment procedures, also TRAMO-SEATS assumes that each intra-year time series is constituted of three different components, not directly observable: the trend-cycle, that represents the underlying medium and long-term movement; the combined seasonal and calendar effects, which are intra-year fluctuations; an irregular component, due to erratic factors. TRAMO-SEATS uses a model-based approach consisting in identifying a reliable and representative model for the time series to be seasonally adjusted.

In order to eliminate the seasonal component, it is necessary to select a decomposition model of the raw series into the previously listed different elements: the industrial production indices are seasonally adjusted using either an additive decomposition (the observed data are equal to the sum of the non-observable elements), or a multiplicative decomposition (the observed data are equal to the product of the non-observable elements).

The industrial production indices are calendar and seasonally adjusted separately for each economic activity sector, Main Industrial Grouping and for the general index, therefore the most aggregated indices are not calculated as synthesis of the seasonally adjusted data referring to lower classification levels. Since the addition of new monthly information allows a better evaluation of the different components of the series, each month previously published data concerning the most recent years are subject to revisions.

The statistical models used for the seasonal adjustment and for the correction are reviewed at the beginning of each year to ensure their ability to correctly represent the trend of the single time series. With the release of January 2022 data, not only unadjusted series have been updated, but also models for seasonally adjustment have been revised up to NACE Economic activity sectors level. In the next months, revision of models will be performed at division, group and class level.

The exceptional variations in raw data recorded during the 2020-21 health emergency were handled according to the guidelines issued by Eurostat, available at the URL:

https://ec.europa.eu/eurostat/documents/10186/10693286/Time_series_treatment_guidance.pdf

To allow the user to adopt the same processing specifications used by Istat in the context of the TRAMO-SEATS procedure, specifications are available upon request for analytical purposes.

Revision of the indices

The industrial production indices concerning the most recent month are provisional and subject to revision that takes place with the dissemination of the following month and takes into account additional information received

²Since the regressor takes the week prior to Easter Sunday into consideration, the differences may be more or less consistent according to whether the whole week falls completely within one month or not.

from enterprises (revised indices are released on occasion of the press release).

A second type of revision occurs annually and concerns the time series of the indices. This revision aims at incorporating three types of information into the indices available after the publication of the first revision. Specifically, the elements considered in the revision process are the following:

- ▶ Responses received from the enterprises after the dissemination of the revised indices (which usually occurs around 60 days from the end of the reference period); it involves a very limited number of responses, which accounts, on average, for approximately 1.5% of the sample (measured in terms of production volume) but which may determine corrections on the disaggregated indices.
- ▶ The ex-post corrections of information already received from the companies, and which, on the basis of successive verifications, result to be affected by errors in the measurement of the phenomenon. Usually these modifications have a minor effect on the aggregated indices, however they occasionally may cause significant revisions for specific sectors.
- ▶ The update and periodic revision of the short-term statistics (turnover index and hours worked), on which the used annual productivity coefficients are based, as previously mentioned, for the products indicated through the monthly flows of hours worked. These products, whose weight, as previously noted, is 13.5%, are concentrated in some sectors (particularly in machinery and mechanical equipment, electrical equipment and, specifically, transport vehicles, repairs and systems installation). As a consequence, the effect of the coefficient revision may be significant for those specific sectors.

Until 2021 these revisions typically occurred when releasing the indices concerning the month of February and incorporated both the new estimates of the short-term statistics for the three previous years and the corrections based on the late responses received and on the corrections to already received information.

Starting from year 2023 retrospective revision will concern the previous year.

Exceptionally, for this year only, the annual revision were disseminated with the bulletin of 9th March 2022 (data release of January 2022) and concerns monthly indices of 2021.

Further information related to short terms indicators revisions is available at <http://www4.istat.it/en/economic-trends/revisions>.

Territorial breakdown

The indices are calculated and disseminated on a national level.

Timeliness

Dissemination of the monthly industrial production indices is made with a press release and series are published on the Istat data warehouse I.stat, 40 days past the end of the reference period.

Dissemination

The press releases are available on the internet site at <http://www.istat.it/en/archive/industrial+production>.

The monthly industrial production indices are available for free at [I.Stat](http://www.istat.it/en/warehouse), the Istat data warehouse, in the section "Industry and Construction /Production/Industrial Production Index".

The description of the execution method of the survey and the activities performed to guarantee the quality of information produced is available in the Quality Information System ([SIQual](#)) of the Istat statistical processes.
