ISTAT - MICRO.3

The building process of a new integrated system of business micro-data 1989–04

Marco Grazzi, LEM, Scuola Superiore Sant'Anna, Pisa

Roberto Sanzo, ISTAT, Roma

Angelo Secchi, LEM, Scuola Superiore Sant'Anna, Pisa

Alessandro Zeli, ISTAT, Roma

Summary: This technical document describes the process of building Micro.3 and the various sources of data that has been linked to it. Micro.3 is an integrated database containing microdata on business firms from different sources for the period 1989-2004. Micro.3 represents the temporal extension of the previous panel called Micro.1, which covered the period 1989-1997.

Key words: integrated sources, business micro-data, consistency checks.

Le collane esistenti presso l'ISTAT - Contributi e Documenti - costituiscono strumenti per promuovere e valorizzare l'attività di ricerca e per diffondere i risultati degli studi svolti, in materia di statistica ufficiale, all'interno dell'ISTAT e del Sistan, o da studiosi esterni.

I Contributi Istat vengono fatti circolare allo scopo di suscitare la discussione attorno ai risultati preliminare di ricerca in corso.

I Documenti Istat hanno lo scopo di fornire indicazioni circa le linee, i progressi ed i miglioramenti di prodotto e di processo che caratterizzano l'attività dell'Istituto.

I lavori pubblicati riflettono esclusivamente le opinioni degli autori e non impegnano la responsabilità dell'Istituto.

1. Introduction

Micro.3 is the outcome of a joint collaboration ISTAT-LEM. The development of MICRO.3 took a considerable amount of time and involved the work of researchers at several units at ISTAT together with collaboration of LEM members during the various phases of the project. What made the project even more demanding was the necessity to bridge together data coming from different sources. Of course, since Micro.3 and the related database contain census data collected by ISTAT it can only be accessed at ISTAT facilities in Rome on the basis of a research agreement.

More technically, Micro.3 is an integrated system of data as it embeds information coming from different sources (as described in the following). As a first rough picture, consider that Micro.3 is built on the backbone of the already existing census of Italian firms operated by ISTAT. On this backbone we “insert” observations coming from other sources to limit possible missing values. In particular, ISTAT resorts, after careful cleaning and controls, to financial statements to fill in the missing values in its census (Biffignandi, Nascia, and Zeli, 2009). In addition, it has also been possible to enrich the database linking to the existing observations other variables concerning export behavior, patenting and innovation activity.

As such Micro.3 offers the researcher a powerful instrument to investigate the dynamics of the Italian industry in the period, 1989-2004. In particular, Micro.3 combines the features of rich cross-sectional information together with the availability of long enough time series. Given the criteria that led the collection of data, the very nature of Micro.3 is a series of cross-sections bound together. However, the careful work of this joint group ISTAT-LEM also allowed to overcome the difficulties that could have prevented to recover the time-series feature of the database. One of the aims of this technical report is to document the work that has been done in order to accomplish this result.

In the following we first present the sources of data we could rely on to build Micro.3 (Section 2). The availability of more than one source also allowed us to verify the extent to which differences sources keep track of the same phenomenon. This is shown in Section 3. Then we focus on the procedures that have led to the creation of Micro.3 from different sources (Section 4). Section 5 reports the list of variables that receive the widest coverage in the database. We also illustrate the routines that can be used to query the database in Section 6. Finally, once that Micro.3 is brought to its final format, we check once again its consistency with the older database for the overlapping years (Section 7) and we present some descriptive statistics for the whole period 1989-2004 (Section 8).

2. Sources

Micro.3 resorts to three different sources of data: the census of Italian firms, (in Italian “Sistema dei Conti delle Imprese”, SCI), SCI, the survey that covers small and medium enterprises, PMI, and annual reports of incorporated firms. These database are described in the following.

2.1 SCI census

The main source of data is the census of Italian firms, also known as SCI census. This questionnaire was sent to all firms bigger than 20 employees. We could access to data starting from 1989. As it will become clearer in the following, from 1998 onwards there has been a change, and now the census is sent only to firms with more than 100 employees. Also consider that the structure of the census as well as some of its questions did change over time in order to provide a constantly updated picture. An important piece of work in the building of Micro.3 has been done to recover common definition for some variables. In this respect we gratefully acknowledge the skillful collaboration and support of ISTAT researchers to help us recovering a unique definition of variables over all the time span covered by Micro.3. In synthesis:

- 1989-1997 The structure of the Income Statement followed the Value-Added method.

- 1998-2001 The structure of the Income Statement has the present form of the standard annual report, according to the Fourth Council Directive.
- 2002-2004 The newer census includes only the “Assets” (“attivo”) among the variables of the balance sheet. There are no information on the debt structure (“passivo”).

2.2 PMI survey

Up until 1997 the old SCI census was sent to all firms with employment figures bigger than 20. Starting with 1998, SCI is only sent to firms bigger than 100. The way ISTAT has chosen to monitor the firms with employment in the range 20-100 is with a “rotating” survey. Further, the PMI (small and medium enterprises) questionnaire only contains a subsample of the variables appearing in the income statement; and it does not contain variables from the balance sheet.

2.3 Ce.Bi. annual reports

The third source of data is made up by the annual reports collected by Ce.Bi. Indeed, Italian law prescribes that all limited liability firms have to hand in a copy of their annual report to the local Chamber of Commerce. Then Ce.Bi (“Centrale dei Bilanci”) collects and performs some controls on the annual report of Italian incorporated firms. This source has become relatively more important for its weight in the number of observations in Micro.3 after that small and medium firms (PMI) are monitored only by means of a rotating survey.

2.3.1 Three flags for the source of variables

From 1998 onward it is possible to resort to annual reports data for Italian incorporated firms. Thus in any year after 1998, the data might come from the SCI or PMI census and/or, it might also happen that both sources are available, from the annual report. We keep track of this, respectively, with the flag variable “scipmi” and “bil”, which take value 1 when the source is available and is a “missing” otherwise. It is important to remember - as this has created some problems in sas - that both “scipmi” and “bil” are character variables even if they take only the values 0,1.

One of ISTAT’s institutional duty is to provide EUROSTAT, on at least an annual basis, with the data for the Structural Business Statistics. As such it also ISTAT’s responsibility to fill in the missing answers both for the SCI and for the PMI groups. To this end, ISTAT employs a number of methods to integrate the data for those firms which do not answer to the SCI census (or OMI survey). The variable “ril” keeps tracks of all the specific cases. In particular “ril” takes the following values:

- ril= missing for observations before 1998 and after 1998 when only the annual report data is available.
- ril=0 data come from PMI survey.
- ril=1 data come from SCI census.
- ril=2 data come from a “donor”. The SCI variables have been filled with data coming from a firm that is similar in terms of size, sector of activity, etc. Then, at later point in time, some years later, it might happen - it might - that the annual report data become available so that it is used to fill these entries. The reason why a “donor” is used to fill in a missing value, thus giving rise to ril=2, is the high priority assigned to recover information for the whole population of SCI.
- ril=3 Firms not responding to the SCI census. Data have been recovered directly from annual reports when there is perfect correspondence between the definition. For those variables with no perfect match or for whom the annual report only report the aggregated variable, we have taken the following procedure. The annual report data of the aggregate variable have been used and splitted into sub-variables employing the corresponding ratio taken from a SCI respondent that is similar in size, sector of activity, etc. Consider the following clarifying example. Take the variable “ACQUISTI” (purchases) from the annual report. Its perfect correspondent from SCI is

“v12100”. So the first step is to plug the data of “ACQUISTI” into v12100. Then in the SCI census, this variable is disaggregated to a finer detail. This greater precision is not accessible through annual reports. Then in the second step we disaggregate the variable “ACQUISTI” from Ce.Bi into three entries (in this case v12101 v12102 and v12103) according to a proportion estimated on SCI respondents similar for size, ateco, etc.

- ril=5 Firms not responding to the PMI survey. Similar procedure as in ril3=.

Clearly the case when ril=2 raises some concerns, because we want to avoid to use a variable that comes from a “donor”, and we have removed these occurrence from the final database, Section 4 describes this and other cases.

2.4 Other database linked to Micro.3

After the aforementioned sources have been merged together we proceed to link Micro.3 to some database developed at ISTAT and to a novel patent database.

COE data

We link Micro.3 to information on exports (and we also plan to include import) thanks to the COE database. All incoming (imports) and outgoing (exports) invoices are registered in the COE so that it is possible to keep track of all transactions. Notice that, due to way COE is built and updated - that is by registering new transactions - it is not necessarily true that it covers a sample of firms completely overlapping with Micro.3. In COE we find indeed also firms with commercial transactions with other countries but lying below the 20 employee threshold set by ISTAT for their census. Given such a situation the link of Micro.3 to export data in COE does not introduce any “selection” bias in the database. On the contrary, we will exploit at best the feature of COE of registering all transactions, in order to be able to properly study the phenomena of firms starting to export.

Patents data

We exploit a patent database that contains the number of registered patents (both USPTO and EPO), and in this respect we gratefully acknowledge skillful research assistantship by Rekha Rao for linking the two database. The patent database contains information on patents granted to Italian firms starting in 1949 for the USPTO and 1978 for the EPO, thus even before the beginning of the period considered for Micro.3. The data coming from the two patent offices were linked to Micro.3 firms as follows. Patent files only report the full name of the company and its address. Asia, another database managed by Istat, contains the full name, the address and the fiscal code of the firms, with no threshold on employment. As a result there are firms in Asia that are not in Micro.3. The two patent databases were first linked to Asia and then, matching the fiscal code, to Micro.3. Since not all firms appearing in Asia are in Micro.3 after the link of patent data to Micro.3 we go from around 68,000 patents relative to 3,858 firms, down to 31,000 patents that got linked to 1,883 firms of Micro.3.

This might look like a dramatically small number of patents and of firms. But let us refer to other studies on similar database. Malerba and Orsenigo (1999) investigates the dynamics of Italian innovating firms. The database they employ for the empirical analysis contains 15175 patents application by 3805 firms (Malerba and Orsenigo, 1999, p. 646). On the contrary we consider here only granted patents, as we consider this a more meaningful proxy for innovation activity. Similar works that still employ as a proxy for innovation patents application has often to rely even on a smaller number of observations (Cefis and Orsenigo, 2001).

Even more difficult is the process of linking data on granted patents to other database, such as Micro.3. This is because the classification used by the patent office and that implemented by the national office for structural business statistics are different. Thus the matching between the two database requires the implementation of some pattern recognition techniques, which not always lead to the successful matching of all the relevant cases.

Indeed, when we refer to empirical works that match patent data to other sources of information the numbers get even smaller (Scellato, 2007).

In the following, as far as the matching of patents granted to Micro.3 is concerned, we will consider the total number of registered patents without distinguishing from the source (EPO or USPTO). This pursues our objective of having the most unbiased proxy of the innovation activity of the firm as possible and at the same time it maximizes the number of links between the two database. In particular, in the following, we are going to employ the cumulative sum of patents over the year, thus assuming that patents are not bearing any depreciation in their value.

3. Consistency checks

As said Micro.3 is the resulting of merging together information coming from different sources. Sometimes difference sources, i.e. SCI and financial statements contain information on the same variable. In those cases it is possible to investigate if the differences between the values of the same variables are large and if they do exhibit some regularity. Fortunately, the answer to both questions is negative. Differences are relatively small and they do not display a clear path, i.e. one of the source providing values constantly bigger (smaller) than the other.

In Table 1 we report the differences (in absolute value) of the values of a variable when this is available both in the ISTAT sources of data (sci and pmi) and in the data from Ce.Bi. with information from the financial statements. For the sake of brevity, data of the sample years 1998-2004 are pooled together, and Table 1 reports the total number of observation falling in ever bin. Seven bins have been built taking differences in the two sources in absolute value. The differences are computed as follows:

The first bin contains observations that display less than 2% of differences between the ISTAT and Ce.Bi. data. The last bin contains those observations reporting a difference that in absolute value is bigger than 100%. Also consider that, although not displayed in the Table (because we report statistics on the pooled sample), the distance between the sources is narrowing over time.

In looking at Table 1 bear in mind that the last line reports the total number of cases when both sources are present, and as such it has nothing to do with the total number of observations available in Micro.3.

Also notice that those variables that appear with the same definition ISTAT (SCI and PMI) and Ce.Bi. (financial statement) report smaller differences. A typical example is the value of Turnover “n11100”. This variable looks exactly the same in the sci/pmi scheme and in the annual reports scheme. Thus, the substantial overlapping between the two sources. On the contrary, since the annual report scheme is not containing a variable for value added, this variable has to be recomputed both in sci/ pmi and in Ce.Bi. Thus, the resulting relatively bigger differences for this variable.

Anyhow, the bottom line is, as we will explain in the following section, to use the data from the sci census or pmi survey when available, and to resort to Ce.Bi only when none of the first two is present.

Table 1: Differences between sci-pmi (ISTAT) data and balance sheet information (Ce.Bi). Occurrences and frequencies

| | Turnover | Production Value | Purchases | Change in stocks of raw materials | Personnel costs | Value added | Employees | Assets |
|--------|-----------------|------------------|----------------|-----------------------------------|-----------------|----------------|----------------|----------------|
| | n11100 | n12000 | n12100 | n12600 | n12400 | n14000 | n31000 | n2200 |
| 0-2 | 106710 87.67 | 100155 82.21 | 78919 66.60 | 61404 67.37 | 100421 82.58 | 45143 37.25 | 43648 46.9 | 39720 70.49 |
| 2-5 | 2431 2.00 | 6457 5.30 | 11106 9.37 | 6064 6.65 | 5934 4.88 | 23571 19.45 | 23453 25.20 | 958 1.70 |
| 5-10 | 1608 1.32 | 3105 2.55 | 7072 5.97 | 3483 3.82 | 4233 3.48 | 18778 15.49 | 12112 13.01 | 960 1.70 |
| 10-20 | 1899 1.56 | 2679 2.20 | 5782 4.88 | 2394 2.63 | 3728 3.07 | 14793 12.21 | 7615 8.18 | 1396 2.48 |
| 20-50 | 3728 3.06 | 4049 3.32 | 6637 5.60 | 2712 2.98 | 4749 3.91 | 11615 9.58 | 4818 5.18 | 3820 6.78 |
| 50-100 | 3555 2.92 | 3587 2.94 | 5853 4.94 | 2498 2.74 | 1969 1.62 | 4158 3.43 | 1113 1.20 | 4914 8.72 |
| >100 | 1789 1.47 | 1801 1.48 | 3133 2.64 | 12591 13.81 | 564 0.46 | 3137 2.59 | 309 0.33 | 4584 8.13 |
| Total | 121720 100 | 121833 100 | 118502 100 | 91146 100 | 121598 100 | 121195 100 | 93068 100 | 56352 100 |

4. Procedures implemented to build Micro.3

We collect and report here the steps that have been performed to bring Micro.3 to its final form.

4.1 Census data first. If missing then integrate with annual report

As a first rule, we employ census data as a “first best”, and only if not available we then resort to financial statement. Indeed, from 1998 onward data from annual reports are also available. However, many reasons - also explained to us by ISTAT researchers - suggest to prefer census data over annual reports. First, it is ISTAT institutional duty to prepare, distribute, collect and carefully verify the data. The capabilities developed there strongly suggest to favour this source over financial statement, if both are available. Then, since annual reports are available only after 1998 - and not for 1989-1997 - it makes sense to prefer census data by ISTAT, when available, to enhance data source homogeneity.

4.2 Getting homogenous definition for variables

Second, it is generally the case that the definitions of variables coincides for SCI-PMI and annual reports; yet, sometimes the definitions in the two documents differ. When this is the case, it is necessary re-define the variable in order to recover a common definition for all sources. In the following we report the definition of those variables that had to be re-computed.

4.2.1 Re-definition of sci-pmi variables

The structure of the SCI census and PMI survey do not perfectly match for all variables. In those cases with differences, variables have been re-defined according to the following expressions.

salari e stipendi (wages and salary):

v4111x=sum(v41110, s42110); if (s42110=.) then v4111x=sum(v41110, p42111, p42112, p42113);

oneri sociali

v4112x=sum(s41120, s42120); if v4112x=. then v4112x=p42121;

TFR

v4113x=sum(s41130, s42130); if v4113x=. then v4113x=p42131;

4.2.2 Re-definition of Ce.Bi. variables

Ce.Bi. data from the annual reports (collected at the Chamber of Commerce) face a similar issue. The definition of some variables, especially those not appearing in the financial statement, do not perfectly match with the corresponding variable computed with SMI-PMI data. Thus the following expressions have used to recover the highest precision as possible for making comparisons.

| TFRQ=FINERAPPORTO+QUIESCENZA | TFRQ=SEVERANCE PAY AND RETIREMENT PACKAGE |
|---|--|
| valore aggiunto v14000b=sum (RICAVIVENDPREST, VARIAZRIMPROD, VARIAZLAV, INCREMIMMOB, ALTRIRIC, -ACQUISTI, - SERVIZI, -GODIMBENI3, -VARIAZMATPRIME, -ONERIDIVERSI); | value added v14000b=sum (TURNOVER, CHANGE IN STOCK OF FINISHED GOODS, CHANGE IN STOCK OF WORK IN PROGRESS, CAPITALISED PRODUCTION, OTHER OPERATING INCOME, -PURCHASES, - SERVICES, - CHANGE IN STOCK OF RAW MATERIALS, -OTHER OPERATING COSTS); |
| margine operativo lordo molb=sum(v14000b, -PERSONALE); | gross operating surplus molb=sum(v14000b, -PERSONNEL COSTS); |
| margine operativo netto monb=sum(molb, - AMMORTAMENTISVALUTAZ, - ACCANTONAMENTIRISCHI, -ACCANTONAMENTIALTRI); | net operating surplus monb=sum(molb, -DEPRECIATION, - OTHER AMORTIZATION); |
| risultato d'esercizio risesercb=sum(monb, -PROVONEFINANZ); | profits from ordinary business activity risesercb=sum(monb, -FINANCIAL INCOME AND EXPENDITURE); |

4.2.3 Re-definition of SCI only variables

In order to determine the value for the aggregates “rettifiche di valori di attivita’ finanziarie” (rectification of financial assets values) e “proventi e oneri straordinari” (non-current income and expenses) the following expressions are computed.

v16000x=s15100-s15200;

v17000x=s16100-s16200;

4.3 Source flag

Since there are different possible sources, we associate to those variables which might come from different sources - SCI-PMI or Ce.Bi. -, an identification flag, “flfv” as follows:

- flfv = 1 variable is coming from SCI-PMI;
- flfv = 2 variable is coming from Ce.Bi.;
- flfv = 0 variable is missing.

4.4 Categorical Variables

Micro.3 contains a lot quantitative variables with economic and financial information. Besides these, it also contains categorical and qualitative variables, as for instance “forma giuridica”, “stato attivita”, “regione”, etc.

4.4.1 Regional dummies

All three sources of Micro.3 (SCI, PMI, and financial statement) also contain information on the geographical location of the firm, so that the coverage of this variable is adequate. Of course one has to bear in mind that the regional dummies only identifies the location of the headquarter; that would perfectly overlap with the firm only in the case of single unit or single plant firms.

The classification goes as follows:

| | | | |
|----|-----------------------|----|------------|
| 1 | Piemonte | 11 | Marche |
| 2 | Valle d'Aosta | 12 | Lazio |
| 3 | Lombardia | 13 | Abruzzo |
| 4 | Trentino Alto Adige | 14 | Molise |
| 5 | Veneto | 15 | Campania |
| 6 | Friuli Venezia-Giulia | 16 | Puglia |
| 7 | Liguria | 17 | Basilicata |
| 8 | Emilia-Romagna | 18 | Calabria |
| 9 | Toscana | 19 | Sicilia |
| 10 | Umbria | 20 | Sardegna |

Further we group together regions belonging to the same geographical area. This is done in accordance with the classification provided by Istat in the document “Codici e denominazioni di ripartizioni geografiche, province e regioni” (ISTAT, 2009) available at www.istat.it. The classification goes as follows:

```
IF reg = 1 or reg = 2 or reg = 3 or reg = 7 then nord west =1;  
ELSE nord west =0;  
IF reg = 4 or reg = 5 or reg = 6 or reg = 8 then nord east =1;  
ELSE nord east =0;  
IF reg =13 or reg =14 or reg =15 or reg =16 or reg =17 or reg =18 then meridione (south) =1;  
ELSE meridione =0;  
IF regione = 19 or regione = 20 then insulare (islands) =1;  
ELSE insulare =0;
```

Note that we do not create the dummy variable for “centro” (center) thus all results from, for instance, regressions will have to compared against the benchmark case “centro”.

4.4.2 Other dummy variables

In order to ease the phase of economic analysis, we also build other dummy variables for exporting and patenting activity. The dummy variable for export, “dummyexp” takes value 1 if the firm exports in that year and zero otherwise. While the variable “dummybrev” takes values 1 if the firm has at least one registered patent up to the year of analysis.

4.4.3 “Forma Giuridica” (Legal Form)

The Micro.3 database also provides information on the legal entity of the firms. The classification is that provided by ISTAT in the document “Classificazione delle forme giuridiche delle unità legali” (ISTAT, 2004).

4.5 Removing observations

Notwithstanding all the cleaning described above it is still necessary to remove some observations from the final database that we employ for statistical and economic analysis.

4.5.1 Removing “fake” census data

From 1998, there are also Ce.Bi data in addition to SCI-PMI sources. Section 2.3.1 describes how some flags, namely “bil”, “scipmi” and “ril” keep track of the source of the data and of how they have been integrated.

Since Micro.3 has been built in order to use microdata for economic analysis, we make all the efforts to get a database that is as close as possible to the original sources; and in particular we want to get rid of any homogenizing treatment on the variables resulting from intervention after data collection, for instance to fill in some blanks due to missing respondents. In this respect the goal of a National Statistical Office and that of an economist might, although marginally, diverge. The main interest of any statistical office is to provide a complete picture of a sector, accepting the loss of precision due to integrating missing answers with as much similar as possible “donor”. On the contrary a (micro)economist is mostly concerned to identify and possibly provide an account of the observed heterogeneity in a sector; and to this end, having “donors” is only harmful, as it - by definition - reduces the variance of the observations.

Clearly the case when ril=2 raises some concerns, because we want to avoid using a variable that comes from a “donor”. Then we solve this problem, removing those observations that satisfy the condition: if ril=2 and bil=' ' then delete;

This operation deletes 4572 observations, see Table 2.

And for the case: if ril=2 and bil='1' we clean the SCI entries for these observations and only consider the data coming from the Ce.Bi source.

4.5.2 Length period of the annual report

The standard period for an annual report is, of course, twelve months, and this happens in the overwhelming majority of our cases, but not always. To improve comparability between firms we restrict our database to those observations with a length period for the annual report of twelve months. if periodofattbil ne . and periodofattbil ne '12' then delete;

This operation deletes 4845 observations, see Table 2. Table 2 provides a succinct picture of these steps and how we get to the final number of observations employed for empirical analysis.

Table 2: Number of firms in each year of the sample 1989-2004.

| Year | ril | 0 | 1 | 2 | 3 | 5 | Observations in each year |
|---|-------|-------|------|------|------|------|------------------------------|

4.6 Industry classification standards over time

Micro.3 spans from 1989 to 2004. Many things have changed in the economy over almost two decades. Some economic activities, for instance the recycling industry, NACE 37, did not even exist as an industry of its own according to the industrial classification adopted back in 1989. During the time interval covered by Micro.3 the standards for industry classification have changed many times. Back in 1989 the classification adopted by ISTAT was the NACE-Clio and the ATECO 1981. In 1991 the standard was set to ATECO 1991, then it was changed again to get to ATECO 2002, the last classification that is relevant for Micro.3. Istat, following Eurostat requirement has just released ATECO 2007 that implements quite a radical change with respect to ATECO 2002. Luckily enough, we do not have to take into consideration yet another change in standards.

The change from ATECO 1981 was particularly cumbersome as it completely reshaped the standard of classification.

Thanks to the fruitful collaboration with Istat it was possible to overcome most of the difficulties related to the change in the classification of economic activities, so that the assignment of firms to the different sectors is done, for all years in the sample, accordingly to ATECO 2002 classification (ISTAT,

2002). Quite obviously, having an industry classification that is invariant throughout all the sample period greatly enhances the possibility of making sensible comparison over the years.

The other issue that one is facing in making inter-temporal comparisons is deflating monetary variables. In 1992, for instance, there was a period of severe speculative pressure, also motivated by high inflation rates in Italy, that caused the devaluation of the Lira, the Italian currency, with the consequent exit from the monetary union. Those years, indeed, reported inflation rates which were remarkably higher than those to which we are accustomed nowadays, especially after the Euro introduction. It is then particularly important to appropriately deflate the monetary variables if one wants to be able to make inter-temporal comparisons.

In order to be able to do so, we deflate our data on monetary variables making use of the 2 or 3 digit sectoral production price index provided by ISTAT and taking 2000 as the reference year. Note that ISTAT provides online many time series of the Italian economy at: <http://con.istat.it/default.asp>. Unfortunately, at the moment, it was not possible to get the appropriate deflator for 1989 and 1990. Indeed, as we recalled above, in 1991 there was quite a radical change in industrial classification, shifting from ATECO 1981 and NACE-Clio to ATECO 1991. It was not possible to get for 1989 and 1990 a production price index that is comparable to the later ATECO 1991 classification. Thus, in what follows we are going to present results on 1989 and 1990 only when this is not going to cause any misrepresentation of the analyses.

5 The list of variables

As explained in the Section **Errore. L'origine riferimento non è stata trovata.** there are three sources of data available, SCI census, PMI survey and the annual reports accessed through the Ce.Bi. database. As said in the previous section we exploit the richness of the sources and also their partial overlapping to fill in possible missing values. Of course, the process of integrating different sources to limit the number of missing only works for those variables whose definitions coincide in both dataset. This happens only for a limited subset of all available variables. For this subset of variables we thus observe a wider coverage and correspondingly, longer time series are generally available. This group of variables is denoted as “nxxxxx”. Bear in mind that what enables to get a long time series is also the accordance of the definition of a given variable in the two periods (1989-97 and 1998-04). Thus also the changing definitions over time limits the length of the time series.

In addition to the group of “nxxxxx” variables, the final version of Micro.3 also contains information on variables that present a more sparse coverage in the database. This is in accordance to the more general criteria that has inspired the preparation of Micro.3 and that suggest to leave as many degrees of freedom as possible on the final user of the database.

In synthesis, these are the group of variables that one can identify on the basis of their origin and, relatedly, their coverage in Micro.3 They are reported in decreasing order of completeness of the series:

- nxxxxx; variables whose definitions perfectly match in the three sources (balance sheet, PMI and SCI) so that it is possible to reconstruct the ‘continuity’ independently by the source available in every year. In addition for most of these variables there is perfect correspondence between the definition of Micro.1 and Micro.3 so that it is possible to recover a longer time series, starting in 1989. This is more true for the Profit and Loss statement. This does not happen so often with the Balance Sheet because Micro.1 had a different definitions of variables (this appears immediately when comparing the Balance Sheet of the old SCI (before 1998) and the new one (after 1998));
- vxxxxx; variables whose definitions perfectly matches in SCI and PMI but of course not in the balance sheet, otherwise they would be nxxxxx. They also start back in 1989, because they have a coherent definition in the new (1998 onward) and old (up to 1997) sci questionnaire;
- sxxxxx; variables from the SCI census. These are the variables from the SCI census that do not match with any of the other database.
- pxxxxx; variables from the PMI survey. These are the variables from the PMI census that do not match with any of the other database.

These variables are reported in the following tables distinguishing between those appearing in the Profit and Loss Statement, Table 3, and for the balance sheet, Table 4. For the reader's convenience, we also report a column displaying the old code for Micro.1; so that it is possible to recover how the 'continuity' of the variables as been recovered in those cases where the definition of the variables in Micro.1 and Micro.3 differed.

Table 3: List of variables from the Profit & Loss statement that is available for all the three sources.

| Codice | Variable definition | Code | | Code |
|--------|---------------------------------------|---------|-------------------------------------|-------------------------|
| Civile | | Micro.3 | | Micro.1 |

| Debiti verso altri finanziatori | OTHER DEBTS | x | | |
| NOTA INTEGRATIVA | ADDITIONAL NOTE | | | |
| DIPENDENTI | EMPLOYEES | n31000 | A160 | |

As said the nxxxxx variables only represent the intersection of the three sources of data so that they are a small subsample of the variables available in Micro.3. The complete - and up to date - list of variables is contained in the list file queryNetCDF.py

Other variables with “broad” coverage

The following variables have been linked to Micro.3 from other sources. So their coverage does not fit into the categories SCI-PMI-BalanceSheet that we have used so far.

They include:
 defl2dgt deflattore prezzi alla produzione a 2 digit;
 exptot totale esportazioni, fonte COE;
 regione codice regione;
 cumsumbrev Cumulative sum of patents.

5.1 Variables for Capital and Investement Measurement

Capital

The only three variables for which it is possible to have the long time series, 1989-2004, are n22000, “Immobilizzazioni”, n22100 “Immobilizzazioni Immateriale” and n22200 “Immobilizzazioni Materiali”. The other variables were not in the older SCI questionnaire (or they were present under different aggregation). These variables, as written in the SCI questionnaire (and conforming to existing civil requirements) are all net of their relative “fondo ammortamento”. As such they are comparable over all the sample lenght, 1989-2004. The remaining nxxxxx variables of the “Immobilizzazioni” are only available from the 1998 onward since it was not possible to recover a common definition between Micro.1 and Micro.3. Also remember that in the PMI there are no variables from the Balance Sheet. Here is a summary of the situation, for clarity we stick to the SCI questionnaire that closely match the accounting requirements of firms (also remember the definition of nxxxxx, vxxxxxx, sxxxxxx, pxxxxxx recalled at the beginning of the section):

Table 5: List of variables for Capital Measurement

| | Nome | Name | code | coverage |
|-------------------------|---|--|--------|-----------|
| | totale B (I+II+II) | total B (I+II+II) | n22000 | 1989-2004 |

| 4) azioni proprie | 4) own shares | s22390 | 1998-2004 | |

Investment

The variables concerning investment are not in the Balance Sheet, so for these variables it is possible to have only the data coming from census (SCI and PMI). Further, questions on investments in the SCI

and PMI questionnaires are different, thus, most of the time it is not possible to recover a common definition even between SCI-PMI. In addition, also the old and the new SCI questionnaires differ. We present a summary table with the “flow” variables of investment and the corresponding “stock” variables.

Table 6: Acquisizioni di immobilizzazioni nell'esercizio.

| Nome | Name | codice flow var | coverage | codice stock var |
|--|--|--------------------|-----------|------------------------|
| Totale (nuovi + usati) | Tangible (new+used) fixed assets | s51900 | 1989-2004 | n22200 |

| Altri beni (nuovi) | Other assetss (new) | s51401 | 1998-2004 | n22240 |
| Altri beni (usati) | Other assetss (used) | s51402 | 1998-2004 | n22240 |
| di cui attrezz per tratt. e trasmis dati (nuovi) | of which equipment for data processing and transmission (new) | v51411 | 1989-2004 | s22241 |
| di cui attrezz per tratt. e trasmis dati (usati) | of which equipment for data processing and transmission (used) | v51412 | 1989-2004 | s22241 |
| Totale (nuovi + usati) | Total Intangible (new+used) | s52900 | 1998-2004 | n22200 |
| Immobil. Immateriali | fixed assests | | | |
| Diritti di brevetto industriale (totale) | rights of industrial patents (total) | s52100 | 1998-2004 | n22102 |
| Diritti utilizz opere ingegno (totale) | rights of utilization of the original works (total) | s52200 | 1998-2004 | s22103 |
| Concessioni, licenze e marchi (totale) | concessions, licences and markes (excepted software) (total) | s52300 | 1998-2004 | s22104 |
| Software (totale) | Software (total) | s52400 | 1998-2004 | s22105 |
| Altre Immobilizz. Immat. (totale) | Other Intangible fixed assests | s52500 | 1998-2004 | xxxxxx |
| Totale immobilizz (mat + immat) (usati) | Total fixed assets (Tang. and Intang) (used) | v53000 | 1998-2004 | n22000 |

| | | | | |
|--|---|--------|-----------|--------|
| Totale immobilizz (mat + immat) (totale) | Total fixed assets (Tang. and Intang) (total) | v53001 | 1998-2004 | n22000 |
| Totale immobilizz (mat + immat) (nuovi) | Total fixed assets (Tang. and Intang) (new) | v53002 | 1998-2004 | n22000 |

Thus, the only three variables for which we get a perfect matching between SCI and PMI are:

- v51200, v51201 and v51202 that refer respectively to the total, new and second hand investment in “Impianti e Macchinari” (n22220).
- v51411 and v51411 that refer respectively to investment in new and second hand “attrezzature per trattamento e trasmissione dati” (s22241).
- v53000, v53001 and v53002 that reports the total investment in “Immobilizzazioni”

It is not possible to recover perfect correspondence for the other variables related to investment in PMI, because they are group in categories that do not match those of SCI. Here is the list of these PMI variables for investments.

6. Routines for querying the database

The previous section described how to get to the final Micro.3 database. The main criteria that have informed the process of building the database is to leave as many as possible degrees of freedom on the final user of the database. As a result, the attempt was to keep the highest level of generality, trying to hold back from taking any choice that one might regret at a later stage of the work. To provide an example of this, consider that Micro.3, in its final format, also contains variables that are available only for a subset of firms, for instance information on white/ blue collar are only available for firms in the sci census (bigger than 100 employees). These variables are still in the Micro.3 even with the consequence of having a more sparse database. And the problem of sparse database is surely an issue for the future. Once that Micro.3 is built according to these criteria it contains 354 variables. We do not provide a complete account or list of them just because some of them have a very limited coverage in the database. Anyway a complete list is contained in the script for querying the database that we describe in the following.

In this section we explain how sectoral files are build (and extracted) from the whole database.

6.1 Storing the database in NetCDF format

To enhance data portability (most of statistical and econometric analysis is indeed performed under unix-like operating system) we store the dataset in a netcdf format. This task is performed by the file makeNetCDF.py

6.2 Querying Micro.3 and assigning ateco codes

It is then possible to query the database with the python file queryNetCDF.py, whose main features are illustrated by its 'help'. This is its output:

Query the NetCVS database for specified sectors and variables. Print compressed (zlib) results to standard output.

Usage: ./queryNetCDF.py [options]
options

- a choose the sectors through ATECO code. Comma separated list of codes (like 151) or ranges (like 150:160) [all sector]
- A select how ateco is assigned to firms [04]; or: at least one year; and: all year; yy: specify the years
- c print a 'fake' firm identification code
- f choose the fields to extract, comma separated list of index (like 2) or ranges (like 2:10). Possible indeces range from 1 to 354. [no variables]
- F Select the input file [pan8904.nc]
- G create one file for each specified sector. The filenames are obtained appending the sector ATECO code to the basename given as option argument.
- p print the firm's ATECO code; the parameter set the lenght of the code, min1, max 3 (don't work with -G)
- v produce verbose output
- h this help message

Probably the only options that deserve little comment upon is "-A" which specifies the procedures assignment of ateco codes. With this option is possible to tell the query file how to build the sectoral files. It is indeed possible to select all firms with a given ateco in a given year.

7. Consistency check between Micro.1 and Micro.3

As explained Micro.3 represents the temporal expansion of the former Micro.1; of course, with the due differences, in terms of census threshold, sources, etc. (see Section **Errore. L'origine riferimento non è stata trovata.**).

As such, the first part of Micro.3 is perfectly overlapping with the ‘old’ Micro.1. Yet, we now proceed to verify this overlapping. It could indeed, happen that some troubles have emerged during the process, i.e. in assembling the database, converting lira into euro. A special mention is due for the criterium to assign atecos to firms. We have to be aware, indeed, that in a 16 years time span it gets quite likely that a firm is changing its principal sector of activity. In this respect, refer to the various criteria that one can choose from to assign an ateco to a firm. The default method, if not otherwise stated, is the ateco of the last year, i.e. 2004.

We now proceed to verify this overlapping between Micro.1 and Micro.3 considering different levels of aggregation in terms of industrial activity classification. To this end, when comparing firms in Micro.1 with those in Micro.3, we extract firms from Micro.3 database assigning them the ateco they had in 1997. This enables for the highest level of overlapping of the two database.

We now compare, by means of tables and plots, the overlapping for the period 1989-97 of Micro.1 and Micro.3.

Plots 2 shows the empirical distribution of (log) employment of firms in the aggregate manufacturing (ateco 15-36). Notice that the two plots are perfectly overlapping in 1997, whether the tails are - very marginally - differing in 1989. This is due to way we assign ateco codes when extracting firms from Micro.1 and Micro.3. Even if, in extracting firms from Micro.3 we ‘assign’ them the ateco they had in 1997, some differences remain in the ‘fields’ from which we pick to ‘assign’ ateco in Micro.1 and Micro.3. The discrepancies in these fields, explains the very small differences we observe in 1989. Note however that the two distribution are remarkably overlapping in 1997, the last year of Micro.3.

The same comments holds true when we consider the distribution of sales, Fig. 2; value added, Fig. 3 and cost of labor, Fig. 4

Figure 1: Kernel density estimate of (log) employment in the aggregate manufacturing (ateco 15-36).

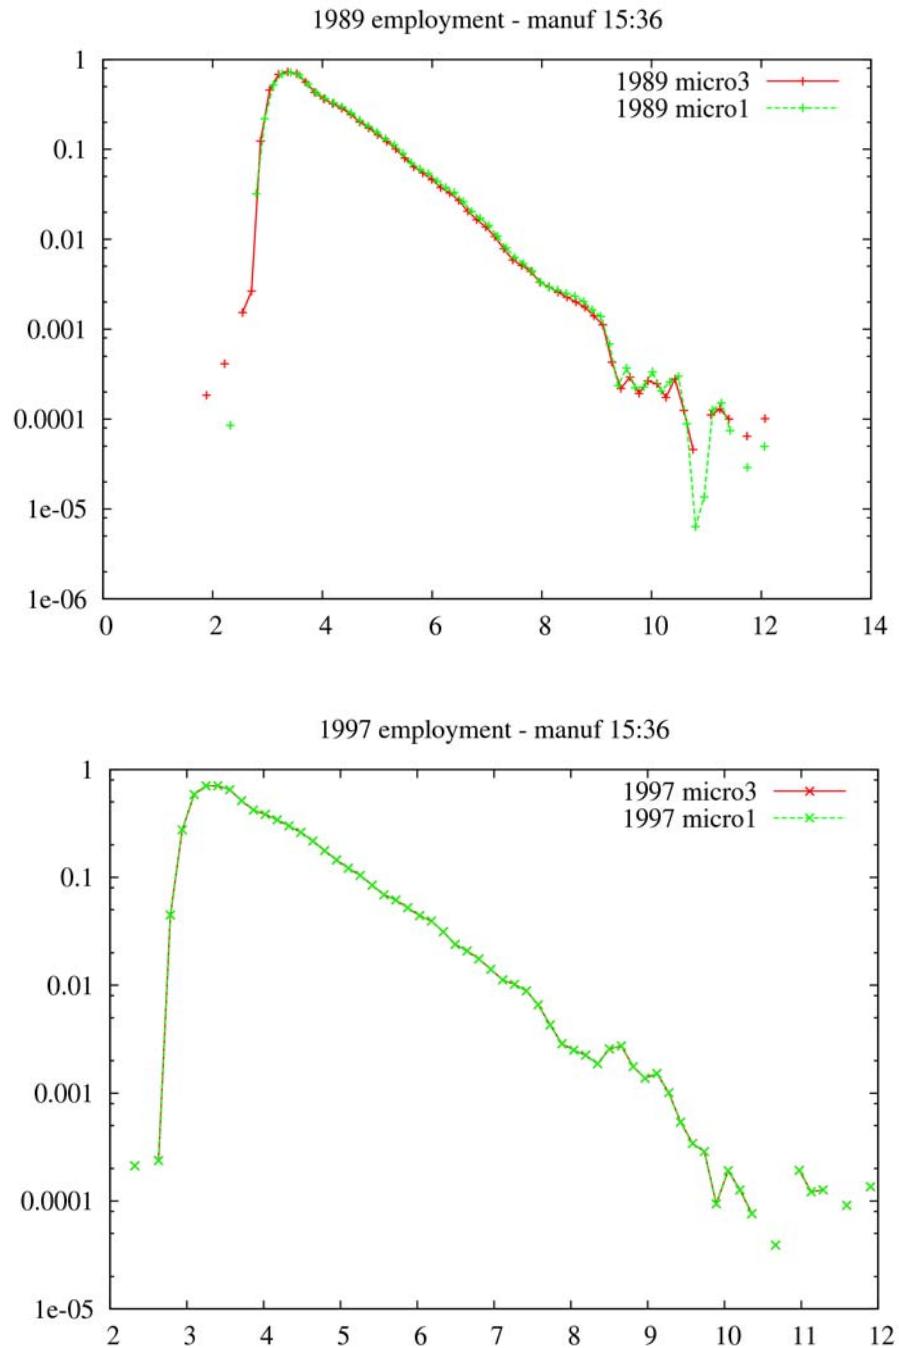

Figure 2: Kernel density estimate of (log) sales (thousands of euro); in the aggregate manufacturing (ateco 15-36).

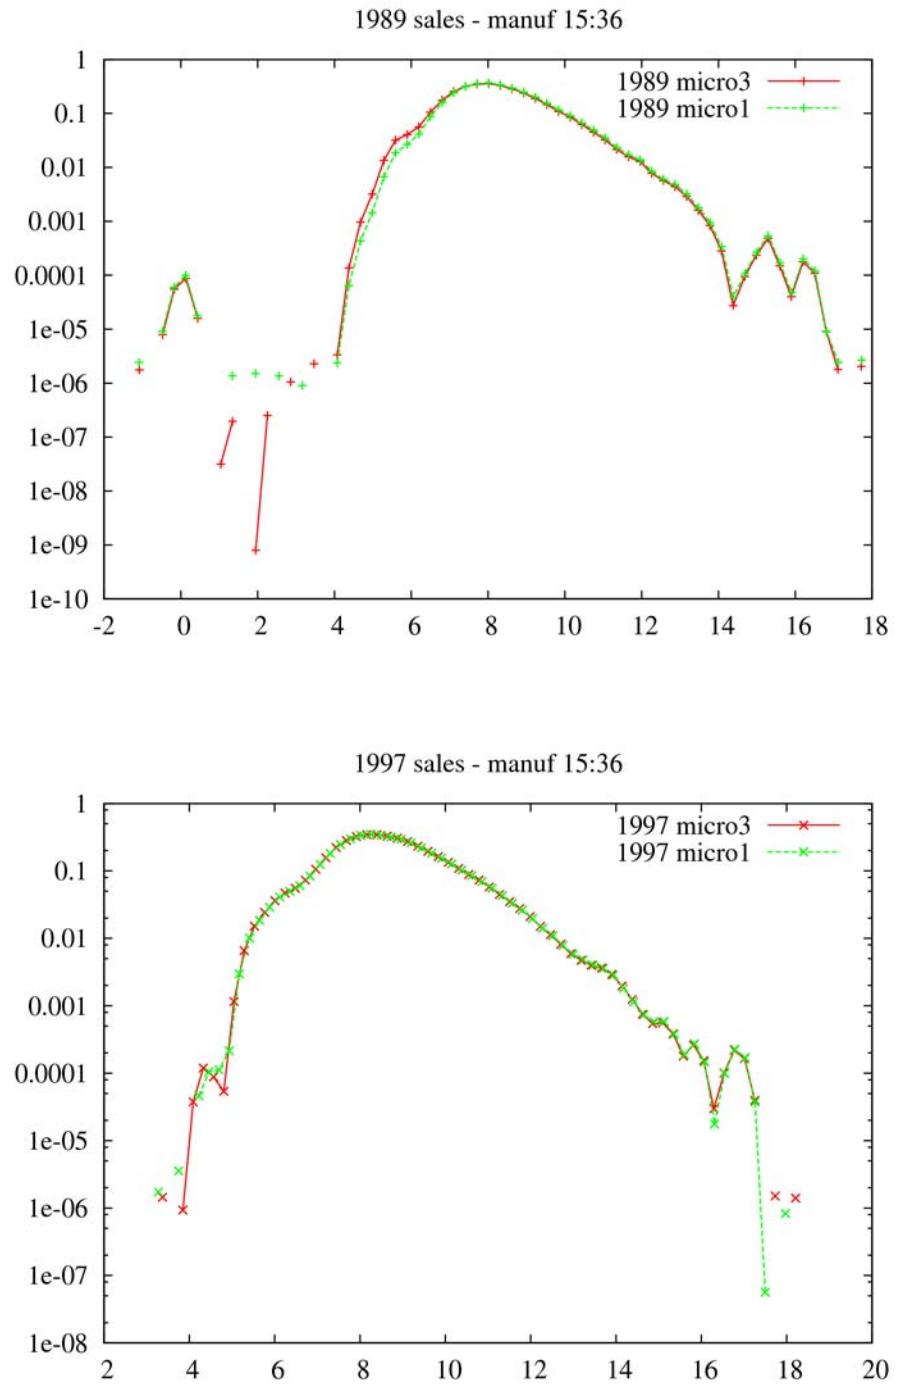

Figure 3: Kernel density estimate of (log) value added (thousands of euro) in the aggregate manufacturing (ateco 15-36).

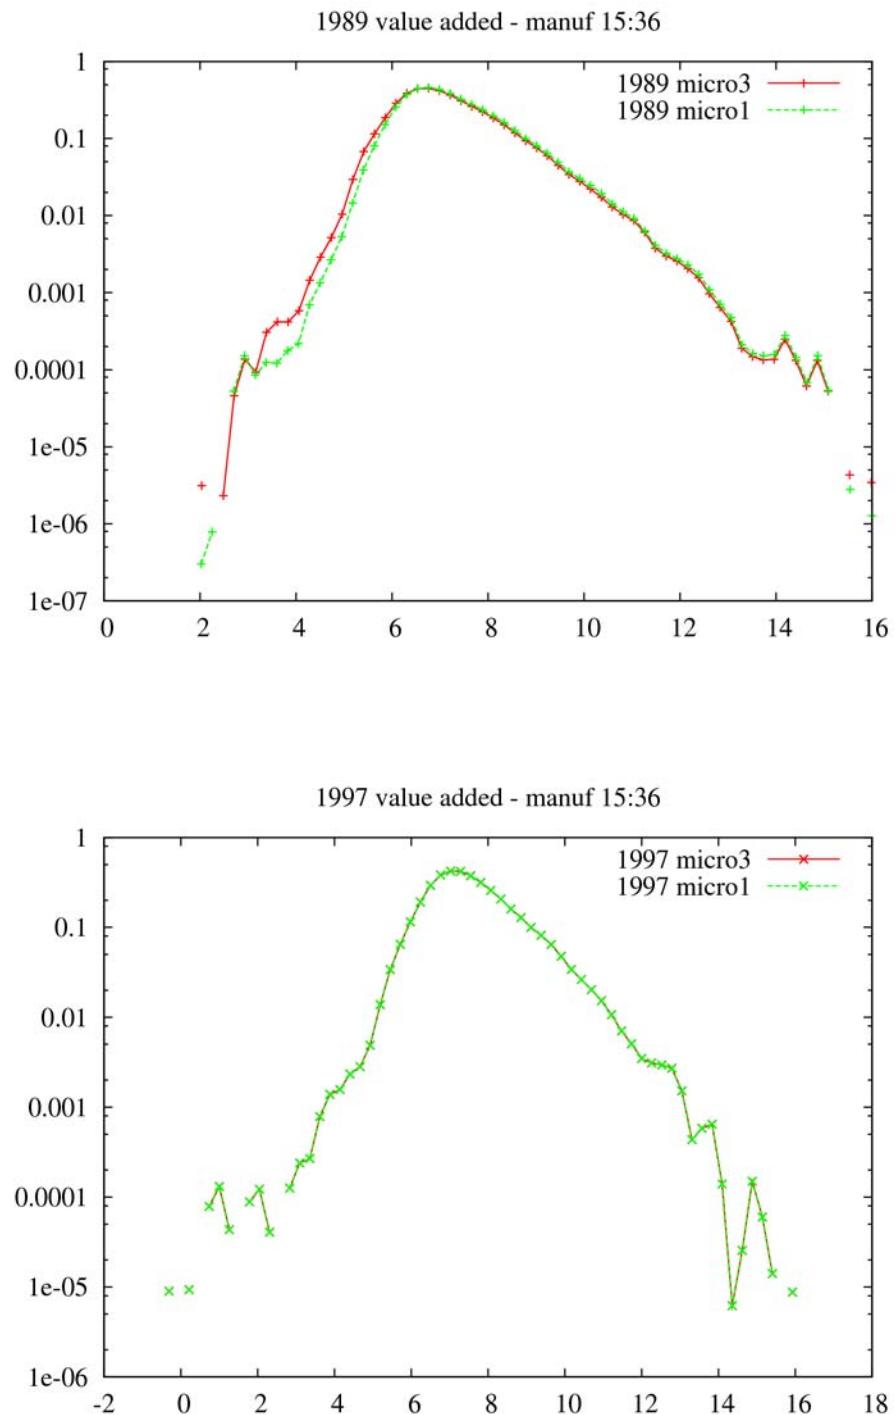

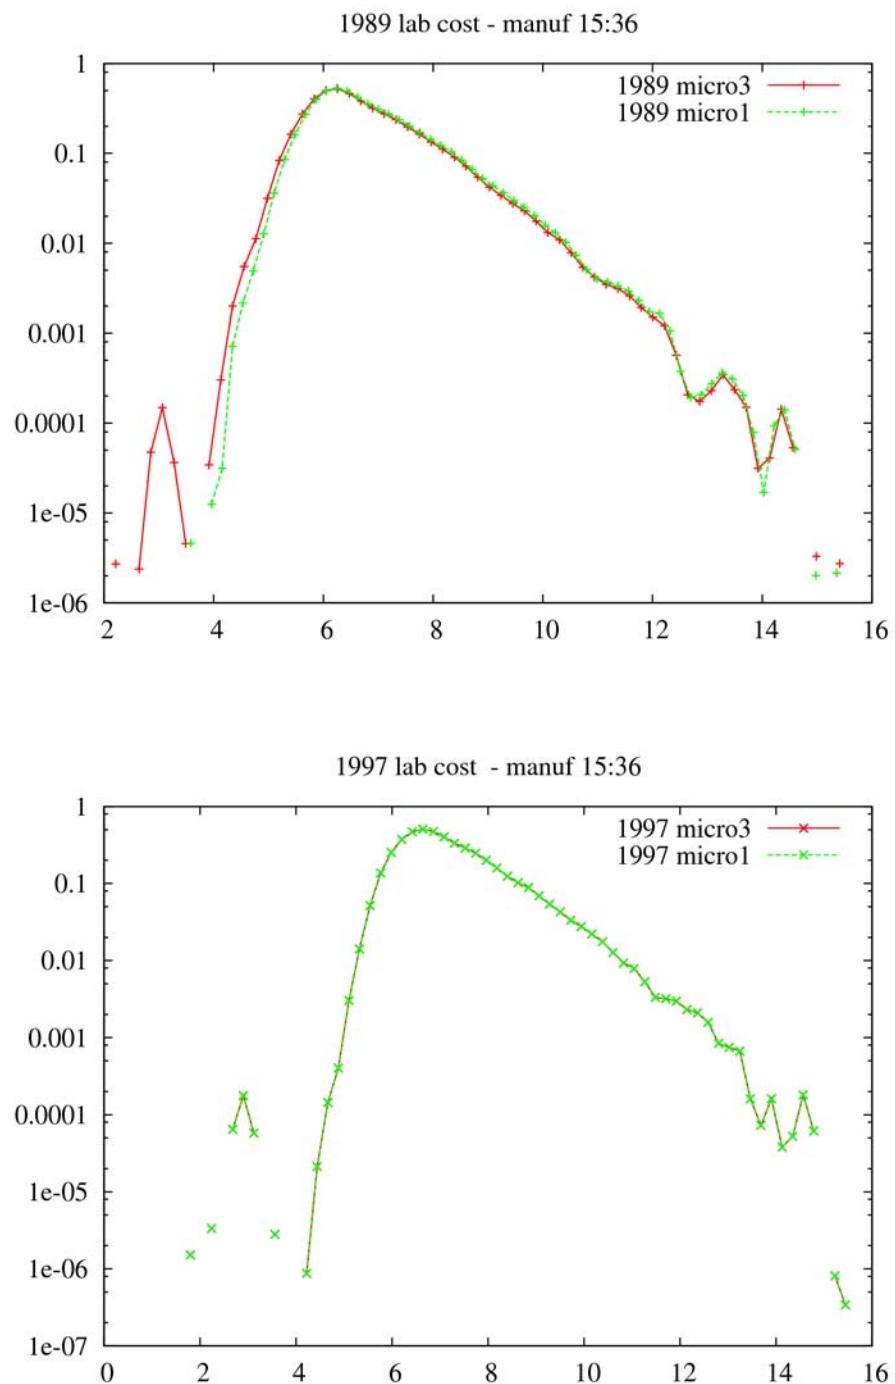

Figure 4: Kernel density estimate of (log) cost of labor (thousands of euro) in the aggregate manufacturing (ateco 15-36).

We then repeat the same exercise with data disaggregated at the two digit level. Plots are reported in Figures 5 to 8.

Figure 5: Kernel density estimate of (log) employment for the textile sector (NACE 17).

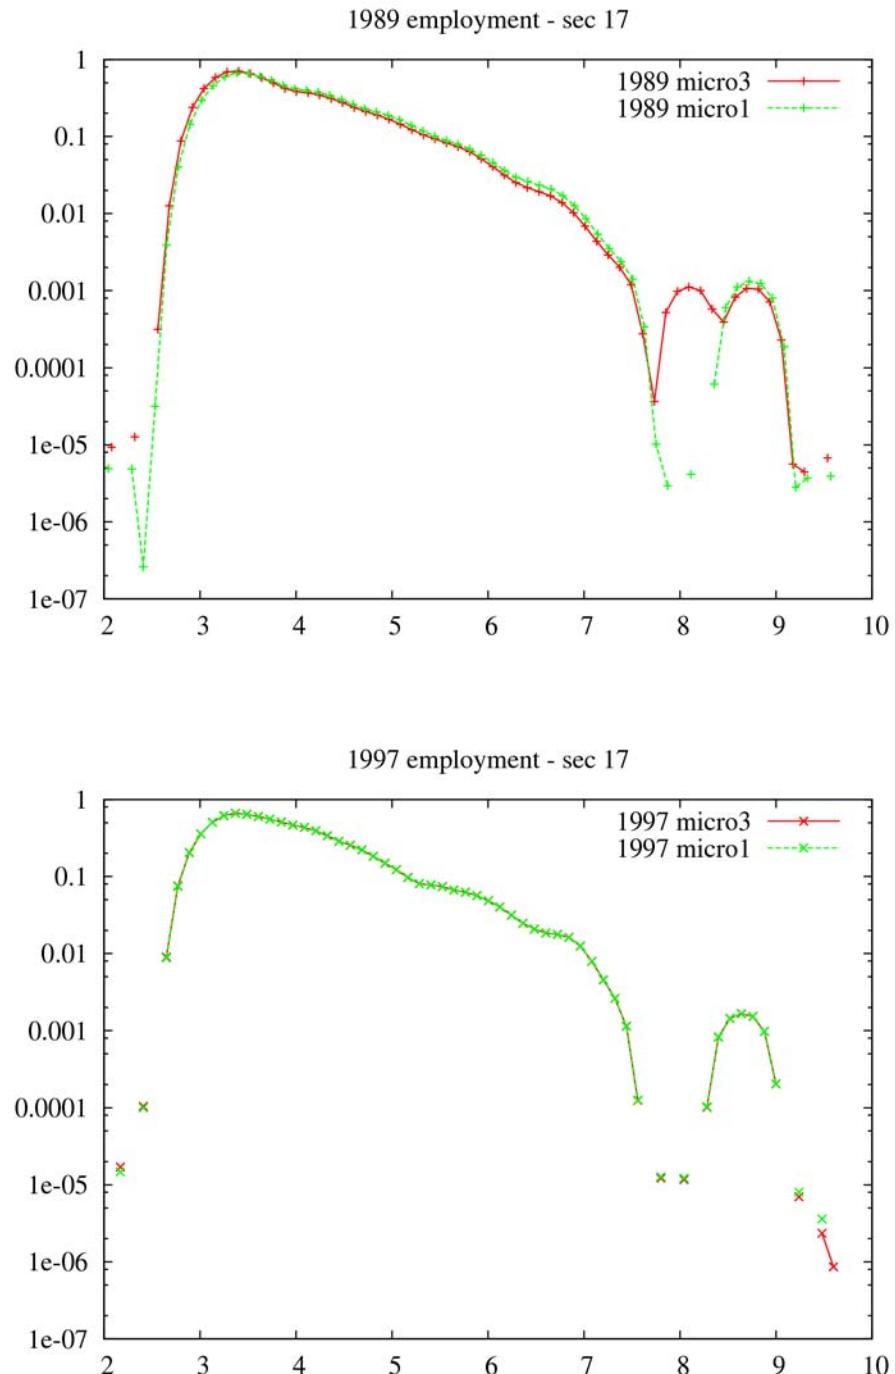

Figure 6: Kernel density estimate of (log) sales for the textile sector (NACE 17).

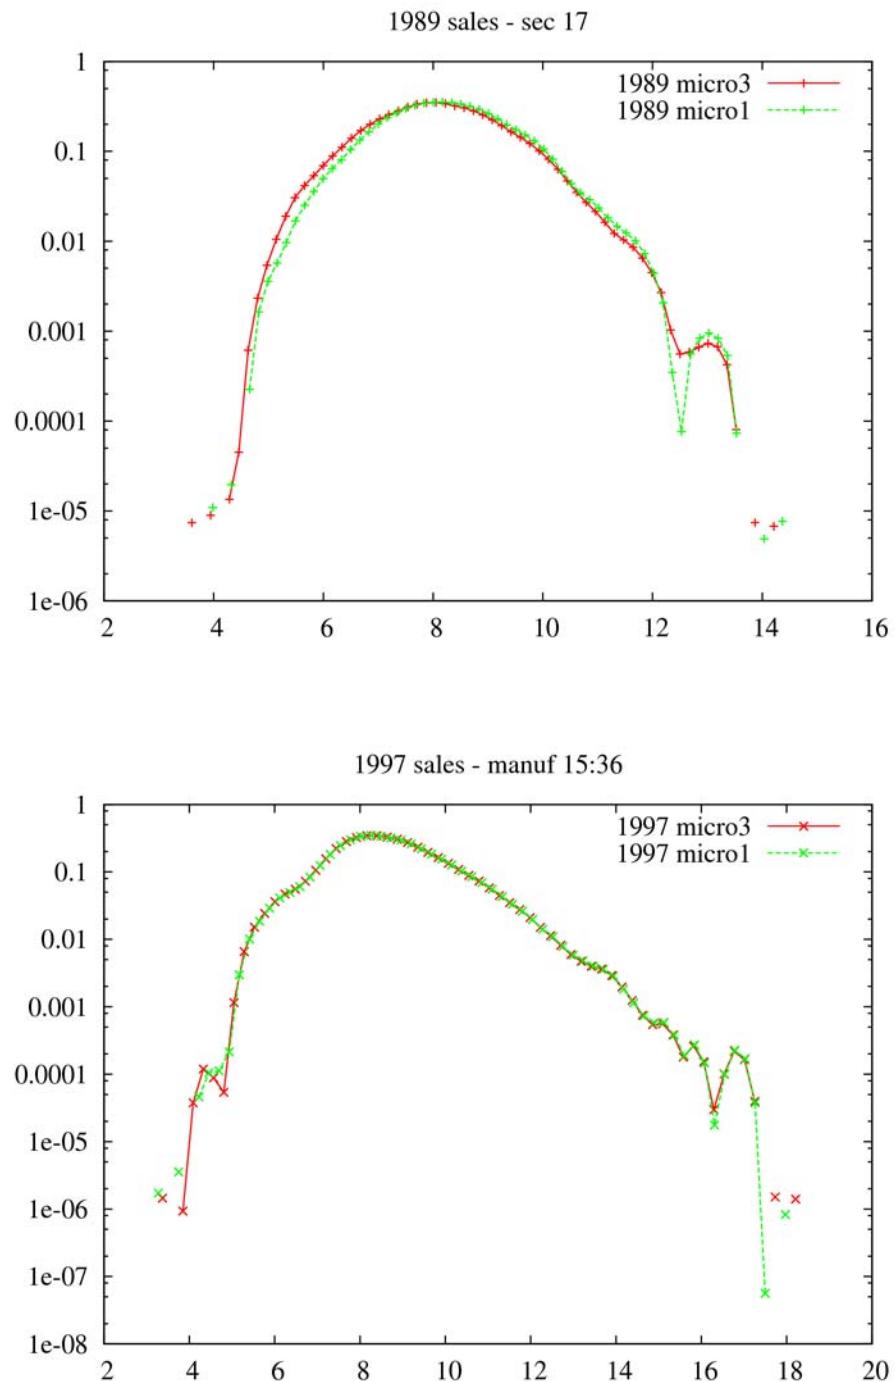

Figure 7: Kernel density estimate of (log) value added for the textile sector (NACE 17).

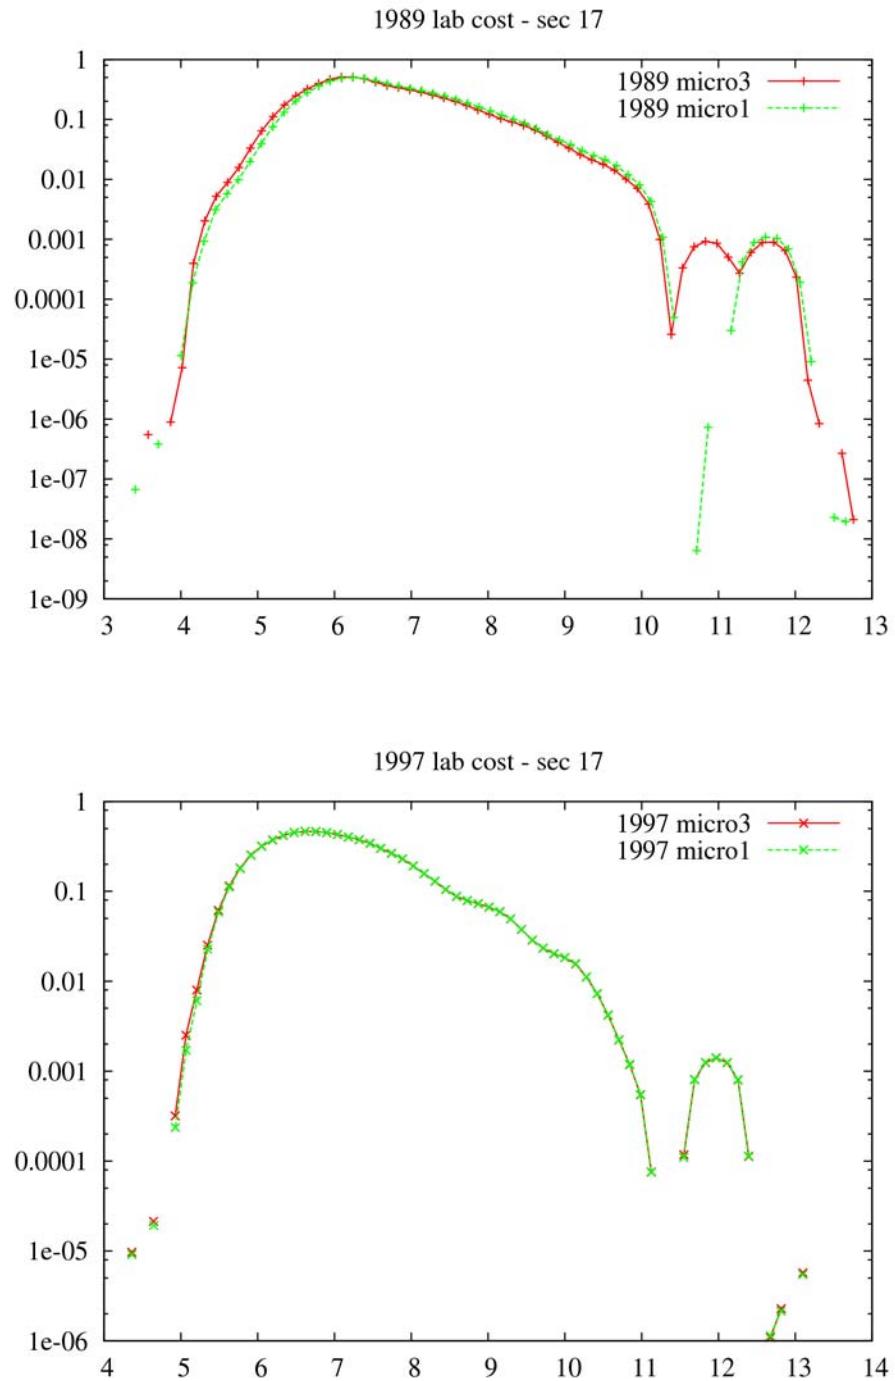

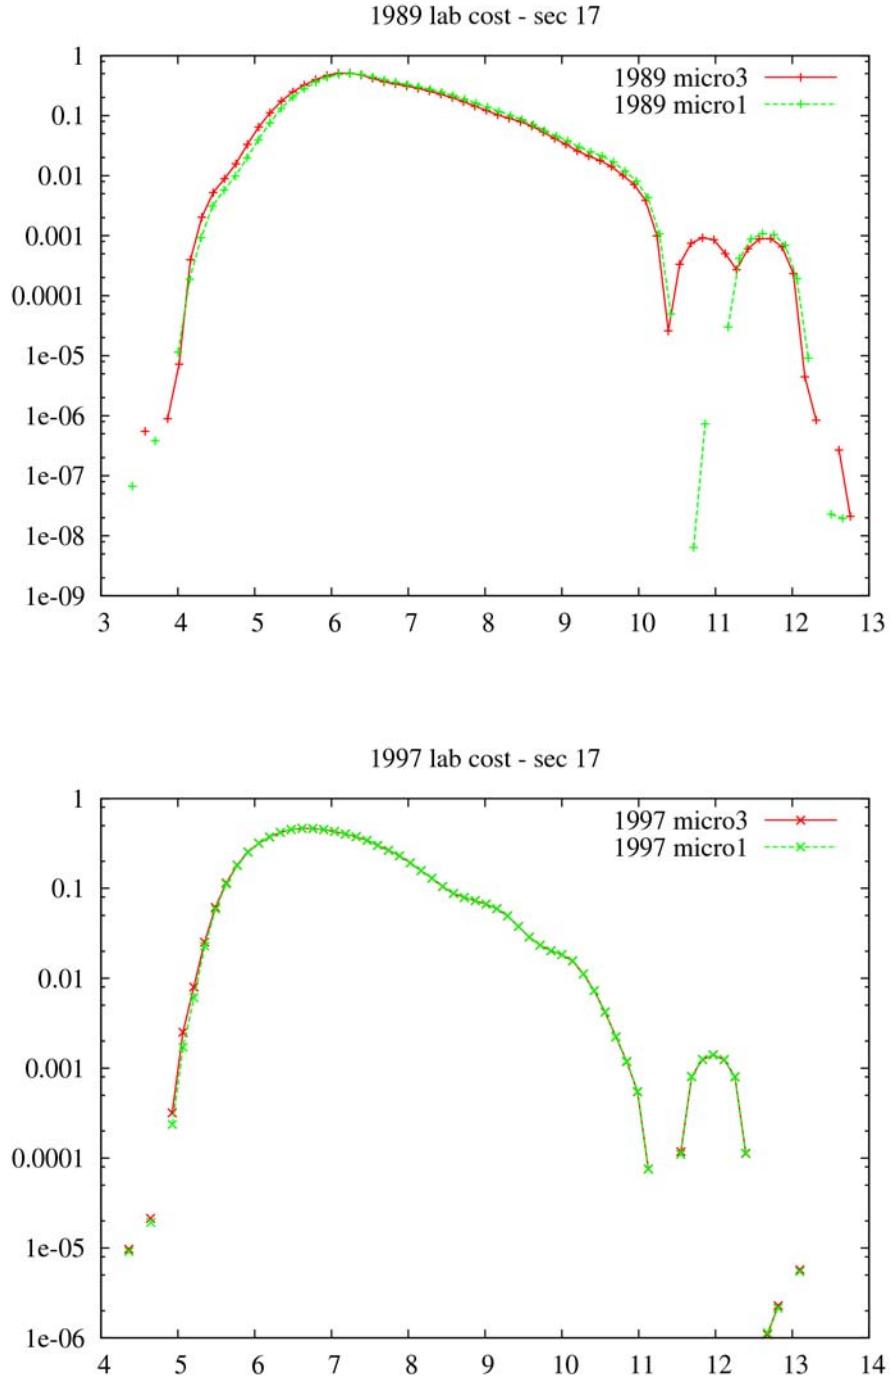

Figure 8: Kernel density estimate of (log) labor cost for the textile sector (NACE 17).

Finally, as a last set of exercise to validate the overlapping of the outcome of the assigning criteria of firms to sector in MICRO.1 and MICRO.3 we report, as already done for in Bottazzi et al. (2007) and Grazzi (2006), some statistics relative to the number of firms in some relevant 3-digit sectors and to their distributions. As already remarked, note the overlapping of this assignment is almost perfect for the last year of MICRO.1, 1997, and worse in the beginning of the period.

Refer to Tables 7 and 8 for the trend over time of the number of observations in Micro.1 and Micro.3 for each 3 digit sector, for the years 1989-97 that are common to both sources.

Table 7: Trend over time of the number of observations in Micro.1 and Micro.3 for each 3 digit sector. Source Grazzi (2006) and our elaboration on MICRO.3 - Micro.1

8 MICRO 3. Descriptive statistics

The descriptive statistics we report here refer to the Micro.3 databank that has been jointly developed with the Italian Statistical Office (ISTAT). The database contains information appearing in firms' financial statements together with the additional variables contained in the annual census conducted by ISTAT. Micro.3 represents a development of the former Micro.1 (see, among other works on this database, Bottazzi et al., 2002; Bottazzi and Secchi, 2003; Bottazzi et al., 2005a, 2005b; Dosi and Grazzi, 2006; Bottazzi and Secchi, 2006; Dosi, 2007; Bottazzi et al., 2007; Dosi et al., 2008; Serti and Tomasi, 2009; Zeli and Mariani, 2009).

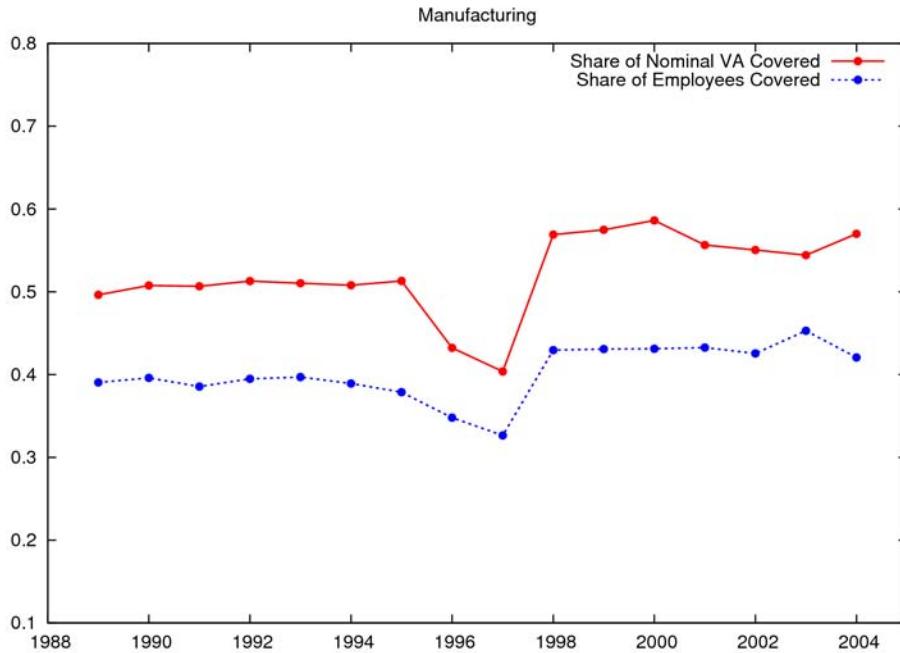

Micro.3 is indeed based on the census of Italian firms with more than 20 employees and covers the period 1989-2004. In particular, starting from 1998 the census of the population of firms concerns only companies with more than 100 employees. As far as firms in the range of employment 20-99 are concerned, ISTAT directly monitors only a "rotating sample" which varies every five years. Further, ISTAT also collects data on those firms not included in this "rotating sample" and on those firms not answering the census. In order to do this ISTAT resort to financial statements.

Very briefly, then, we merged information on firms coming from three distinct sources: SCI for firms bigger than 100 employees, PMI for firms in the range of employment 20-100, and financial statements to fill in as many missing values as possible (an extended explanation of the procedure is in Section 4). Having more than one source of data enabled us to accomplish, in a former and preparatory phase of our work, two objectives. On one side, quite obviously, resorting to financial statement information when data from the National Statistical Office are not available enhance the completeness of the database. On the other, when data from both sources are available, it is possible to check for the reliability of the balance sheet data. Results of this consistency checks, which also had to take into account slight difference in definitions, were positive. In particular, and as explained extensively in Section 4 when for a certain variables, both sources are available (from one of the two census and from financial statements), we employ the one coming from the ISTAT census, as it is considered more reliable.

After linking of the two database, Micro.3 contains data for 134625 Italian firms, of whom 60084 are active in the Manufacturing sectors. The possibility to resort to a second source of data from 1998 onward also resulted in an increased representativity of our sample of firms as compared to all firms active in the Manufacturing sectors. As shown in Figure 9, Micro.3 covers more than 50% of value added generated by all Italian Manufacturing firms, as reported by Eurostat; and more than 40% of

employment. It is possible to observe a fall in the coverage ratio in the years 1996 and 1997. That is due changes in the practice of Statistical office that took place in 1997.

Figure 9: Coverage of Micro.3 in terms of employment and value added. Our elaboration on Micro.3 and Eurostat data

As far as the classification of industrial activity is concerned, in the present document, as well as in the analysis of Micro.3, we refer to the international classification NACE rev 1.1, as it perfectly matches with Italian industrial classification ATECO 2002 (see also Section 4.6 above).

Finally, to ease the interpretation of results, we also report all variables in Euro, even though, at the time, these reports were filled in Lira currency. Bear in mind that during the period under investigation the Italian currency with legal tender status was the Italian Lira whose exchange rate with the Euro was later fixed at 1 euro per 1936.27 Lira.

8.1 Descriptive Statistics on 2 Digit Sectors

In the following we report some tables that depict the evolution over time of some relevant variables of Micro.3. Table 13 reports the number of firms in each 2 digit sector for the whole economy. In the following we are going to focus on manufacturing sectors only, but for time being we are interested to appreciate the evolution of Italian Economy as recorded by Micro.3.

As far as the number of observations per year is concerned, MICRO.3 reports information on more than 31.000 in 1989 and more 61000 firms in 2004. In general, as already apparent in Table 2 the increase in the number of observations is mostly due to the availability of financial statements starting from 1998 onward. Also notice that the number of observations displays a drop in the years 1996 and 1997. Indeed, the last two years of the old census reported a decrease in the number of available observations, yet after the restructuring of the census procedures and also thanks to the integration with annual reports data, the number of observations registered a steady increase up to more than 61000 firms in 2004.

The trend in the number of observations (firms) in each 2 Digit sector is reported in Table 13. It also enables to appreciate the emergence and development of some sectors among the manufacturing industries. That also tells us that, to some extent, some important changes in the structure and composition of the manufacturing industry are already visible in the descriptive statistics. Take for

instance, the recycling sector (NACE 37), it only had four firms bigger than 20 employees active in 1989, whether in 2004 there were 125 companies in this sector.

Table 13: Yearly number of observations in each 2 digit sector. Source: Our elaboration on Micro.3.

There is, of course, also a more direct way to assess the changes in the composition of the Italian industrial structure; and this is achieved analyzing the shares of turnover and value added in the different manufacturing sectors during the period of observation, 1989-2004. Let us focus on the share of turnover of each 2 Digit sector in the manufacturing industry as reported in Table 14. In 1989 the “number one” sector was Food and Beverage (NACE 15) and the second was that of machinery (NACE 29), in 2004 the top 2 sectors are just inverted and as far as the other sectors are concerned most is left unchanged. Analogously, Table 16 reports the share of value added of every industry in the manufacturing sector. Quite interestingly we notice that the ranking on value added displays many differences with respect to the share in total sales (Table 14). In 1989 the machinery sector (NACE 29) is the one with the highest share of value added, and the sector of Motor vehicles and trailers (NACE 34) ranks second. The sector of Food and Beverages ranks only fourth, after that of chemical products (NACE 24). Again, the ranking is almost unchanged in 2004. Most notably, in the last year of our sample, the share of value added accounted for by firms in the machinery sector (NACE 29) has steadily reached the 15%.

A legitimate question concerning the properties of the database Micro.3 is its representativeness of the Italian economy. More precisely, and limiting for the time being to the manufacturing industry, how representative is Micro.3 of the actual Italian sectoral composition? We have already seen (cf. Figure 9) that the coverage provided by Micro.3 for the whole Italian economy is fairly large, around 40% percent for employment and 50% when considering value added. We now want to know if there is any bias in the sectoral composition of this sample so that an industry is over/under-represented. Table 14 shows the share of turnover (as total sales) for each 2 digit sector in the manufacturing industry. Figures in Table 14 can be compared to that in Table 15 which reports the same statistics, now computed on aggregate Eurostat data. Comparison of the two tables witnesses the very good representativity of our database in terms of the composition of sectors, both with respect to turnover, Tables 14 and 15, and value added, Table 16 and 17.

As a side remark notice that the top five sectors in terms of value added share (that is NACE 15, 24, 26, 29 and 34) accounted for 45.18% of the total valued added produced by the manufacturing industry. And the same five sectors still represented 45.02% of value added in 2004. That, again, tells of the relative invariance in the core of the Italian industrial structure.

Table 14: Contribution (percentage) of each sector to the turnover (as total sales) of manufacturing. Source: Our elaboration on Micro.3

Table 18 and 19 reports the distribution of the number of firms per size classes, where size is proxied by employment. We report the figures for 1989, 1997, 2000, 2004, and for the manufacturing sector only. Let us focus on the class of biggest firms (more than 250 employees). It is, once more, apparent the disproportionate share accounted for by small and medium firms. Nonetheless, let us focus, as we did before, on the five largest sectors in terms of value added (NACE 15, 24, 26, 29 and 34). When we restrict our analysis to these sectors, we observe that three out of five (26, 29 and 34) did increase the share of firms in the size class “more than 250 employees”. For a detailed discussion of the impact of the new techno-economic paradigm on the industrial structure, see also Dosi et al. (2008).

This trend is somehow inverted when considering the share of employment per size class, Table 20 and 21. Among the top five sectors for value added (NACE 15, 24, 26, 29 and 34) only that of other non-metallic mineral product (NACE 26) increased the share of employment in firms bigger than 250 employees. Nonetheless, the top five sectors still report very high shares of employment in the class of biggest firms, when compared to the other manufacturing industries.

In line with the previous summary statistics, Tables 22 and 23 report the value added produced by firms of different size classes. Again, take as a reference the bin of largest firms and focus on sectors 15, 24, 26, 29 and 34. In line with the evidence on employment reported in Table 20 and 21 these sectors (with exception of NACE 26) display a decreasing share of value added accounted for by biggest firms.

Table 22: Share of value added per size cohort, percentages. Source: Our elaboration on Micro.3.

8.2 Descriptive Statistics on selected 3 digit sectors

In this section we present, as we did for 2 digit sectors, some descriptive statistics for a selection of 3 digit industries. Sectors that are reported in the following tables are those with the highest number of observations. The threshold for inclusion is 100 employees: a 3 digit sector is included if in any of the year 1989-2004 it has reached the 100 employees threshold. According to these procedure we report descriptive statistics for 55 sectors out of the available 103 3-Digit industries. Then, results are provided taking as a reference the sample of the selected 55 3-digit sectors. So that, for instance, the total number of observations in 1989, 17469, as reported in Table 24 and 25 is the sum of firms in the selected 55 industries and not in all 103 3-Digit sectors.

The trend in the number of observations, as reported in Table 24 and 25 closely mirrors the trend observed for the whole Micro.3 database; that is we record a general increase in the number of firms monitored every year, with the exception of 1996 and 1997, as a result of the changes in the procedure applied by ISTAT. From 1998 onward, and also thanks to the availability of financial statements in addition to the ISTAT's census, the number of observations increases constantly. Of course given the generalized rising trend in the number of firms it is not easy to make a bold statement concerning the tendency in sectors under investigation. Such conclusion might however be drawn on the basis of the evidence in the following tables.

Table 24: Yearly number of observations in each 3 digit sector. Source: Our elaboration on Micro.3.

| | SECTOR | '89 | '90 | '91 | '92 | '93 | '94 | '95 | '96 | '97 |
|-----|---|------|------|------|------|------|------|------|------|-----|
| 151 | Production, process & preserv. of meat | 293 | 304 | 279 | 291 | 321 | 307 | 286 | 231 | 202 |
| 155 | Dairy products | 186 | 189 | 185 | 202 | 215 | 216 | 198 | 177 | 152 |

Analogously to Table 16, we report in Tables 26 and 27 the contribution of each sector in terms of value added. As it could be expected, we find again 3-Digit sectors that belonged to 2-Digit sectors with the highest share of value added (Table 16). This is the case for the production of basic chemicals (NACE 241), pharmaceuticals (NACE 244), machinery for production (NACE 291) and other special purpose machinery (NACE 292) to mention but a few. One exception is represented by the wearing apparel sector (NACE 182) and this is partly explained by the varying numbers of sectors making up a 3-Digit industry. Sector 18 is made up by 3 sub-sectors only.

Table 26: Share of Value Added in selected 3 Digit sectors. Source: Our elaboration on Micro.3.

The following tables report respectively, the share of the number of firms in every size class (Tables 28 and 29); the distribution of employment among size classes (Table 30 and 31) and the distribution of value added among size classes (Tables 32 and 33).

Table 28: Distribution of number of firms per size class, percentages. Selected 3 digit sectors in the Manufacturing.
