### FERTILITY INTENTIONS AND REALIZATIONS THROUGH A LONGITUDINAL REGISTER OF INDIVIDUALS IN ITALY

CINZIA CASTAGNARO, Istat – ELEONORA MELI, Istat –  
LETIZIA MENCARINI, Univ. Bocconi – DANIELE VIGNOLI, Univ. Firenze

# Index

---

- Background
- Data and methods
- Main results
- Conclusions and further developments

# Italy's Fertility Decline – A Persistent and Growing Gap

---

## ○ Key Facts (ISTAT, [demo.istat.it](https://demo.istat.it)):

370,000 births in 2024 (preliminary data) → lowest ever in Italian history

Total fertility rate: 1.18 in 2024 (estimate) vs. 1.19 in 1995

Mean age at childbirth:

1952: 26 years

2024: 32.6 years (estimate)

## ○ Desires vs. Reality:

73% of adolescents (17–19 years) wish to have children.

*Of these: 62% prefer 2 children, 18% prefer 3+ (ISTAT, 2023)*

# Italy's Fertility Decline – A Persistent and Growing Gap

---

But in reality, women born in 1973:

- 22% is childless
- 35,6% had 2 children
- 10,3% had 3 or more

→ A clear-cut “fertility gap” between intentions and outcomes

# Childlessness and Unrealized Fertility Intentions

---

## Current Trends:

45% of women aged 18–49 are childless

Yet, in 2016 (FSS):

>75% of childless women expressed a desire for children

<25% declared no intention to have children

## “Excess Childlessness” in Italy

Italy shows the largest gap between intended and actual childlessness in Europe

>20 percentage points of "unrealized fertility" (Beaujouan & Berghammer, 2019)

**Postponement often turns into renunciation**

# New Data to Understand Fertility (Non-)Realization

---

Key Question:

**Why do so many individuals have fewer children than they initially intended?**

- The only Italian study: **FSS 2003–2007** (Regnier-Loilier & Vignoli, 2011)
  - **Found socioeconomic conditions to be key predictors**
  - **No recent data available**
- **Our Contribution:**
  - **First fertility longitudinal register in Italy**
  - **Built via record linkage techniques**
  - **Enables monitoring of fertility intentions and realizations over time**

→ A new foundation for understanding the **barriers to childbearing** in contemporary Italy

# Data and methods

---

The project within the ISTAT Research Laboratory

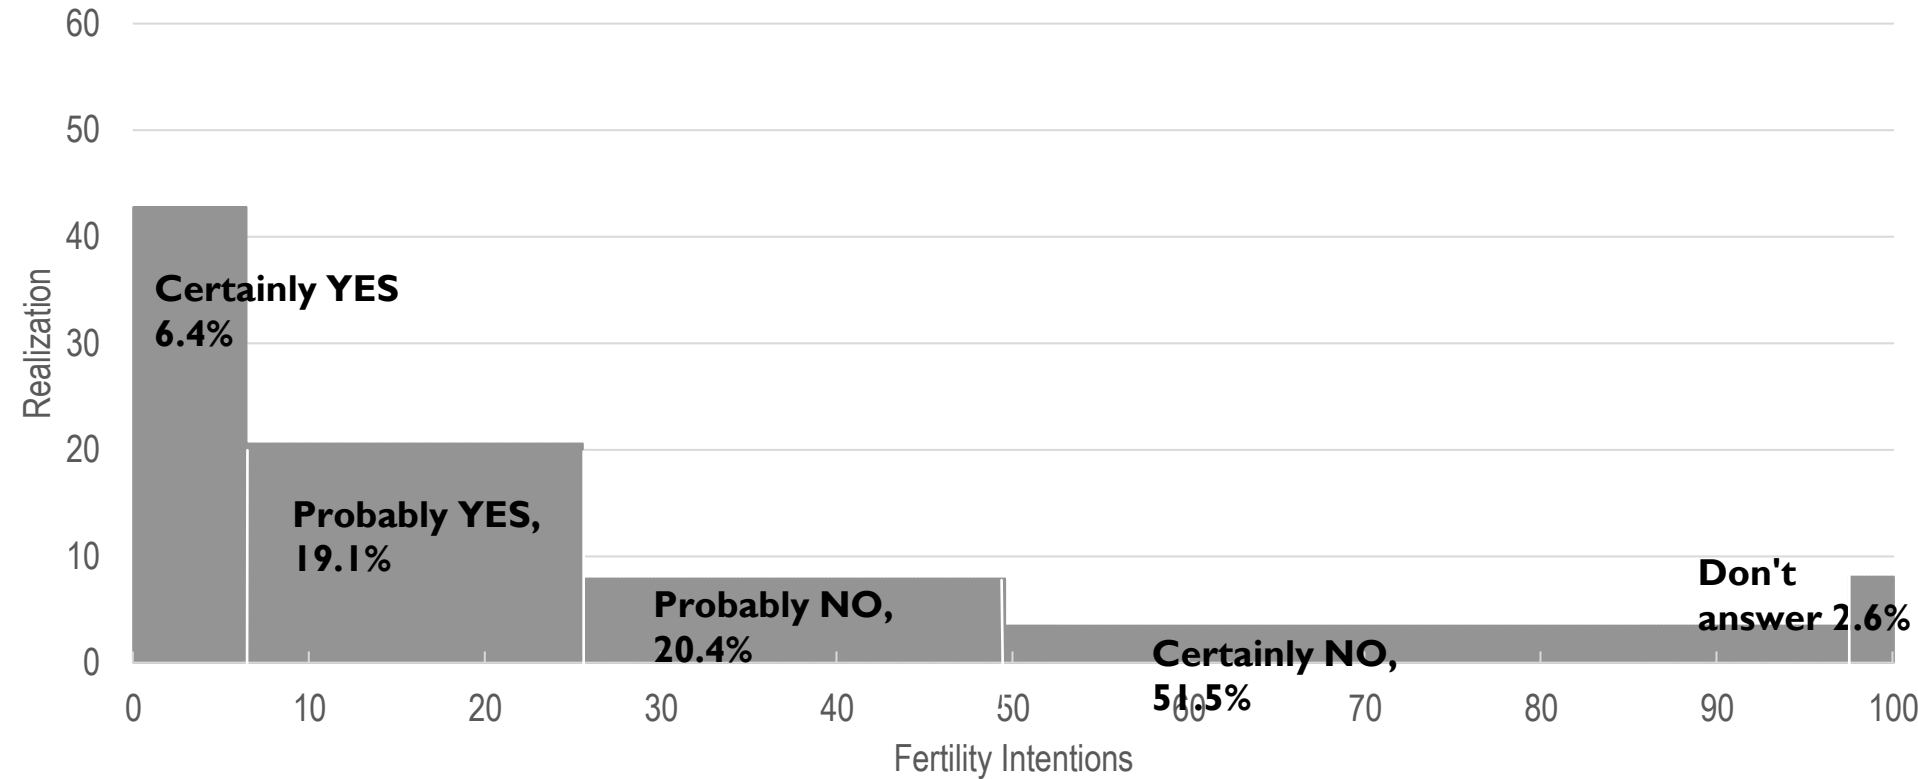

- creating a **thematic longitudinal register by linking FSS16** (Families, Households, and Life Cycle Survey) and **RBI2023** (Base Register on Individuals as of December 31, 2022).
- By using **pseudonymized keys** to connect these sources
- Analysis **births among women aged 18 to 49 and demographic changes within families.**

Procedure followed:

- **Pseudonymization and Linkage:** FSS16 was pseudonymized using individual keys (SIM), allowing linkage with the 2023 Base Register of Individuals (RBI23). The family key (cod\_famiglia) was used to connect the women interviewed in FSS16 with RBI23 data to include all members of the same family.
- **Sample Selection:** from FSS16, 5,587 women aged between 18 and 49 were selected, totaling 5,432 families and 17,185 individuals in RBI23.
- **Final Results on Births and Mothers:** **1,031 children born after 2016 were included in the dataset.** The number of corresponding mothers is divided by parity as follows (unweighted totals): 686 had 1 child; 160 had 2 children; 7 had 3 children; only one had 4 children, for a total of **854 mothers.**

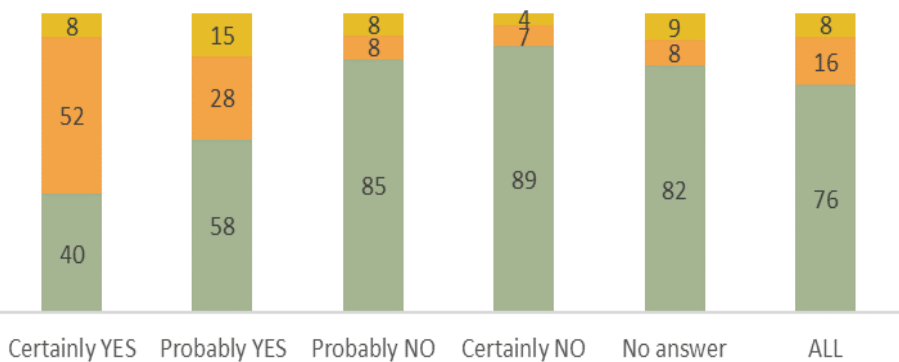

# Fertility realization

WOMEN AGED 18–49 IN 2016 WHO HAD AT LEAST ONE CHILD IN THE THREE YEARS FOLLOWING THE INTERVIEW, BY FERTILITY INTENTIONS. YEAR 2016.

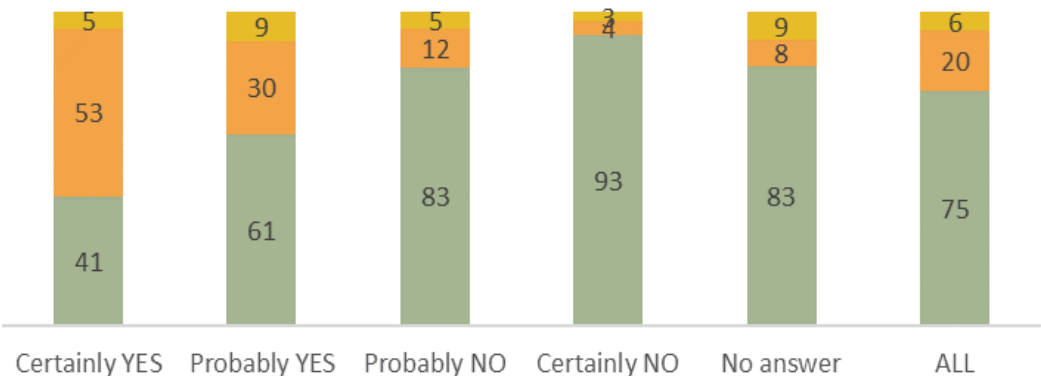

# Fertility realization by Age

18-29 YEARS

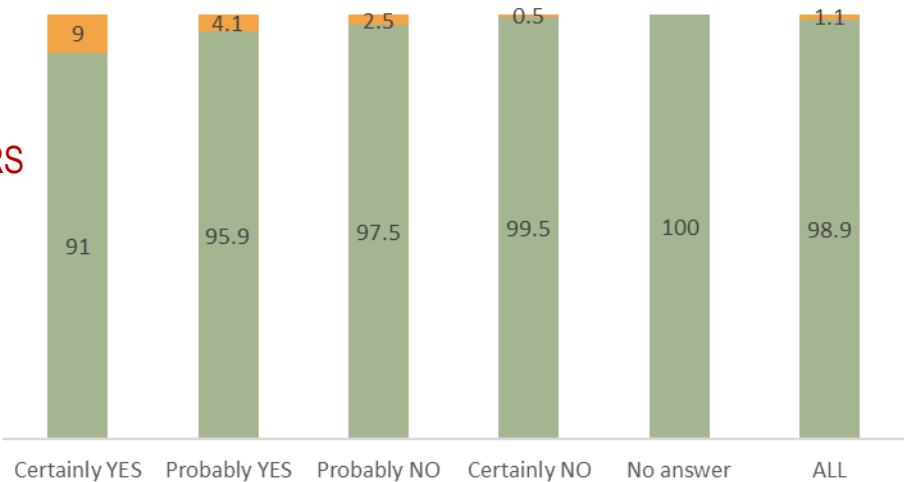

30-39 YEARS

■ No one in the three years, at least one after three years  
■ At least one in the three years  
■ No one

■ No one in the three years, at least one after three years  
■ At least one in the three years  
■ No one

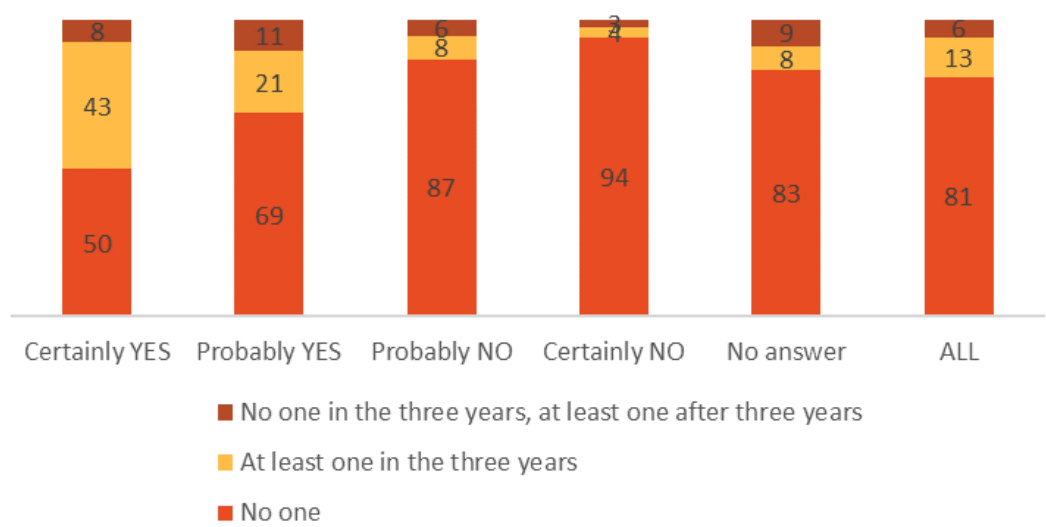

40-49 YEARS

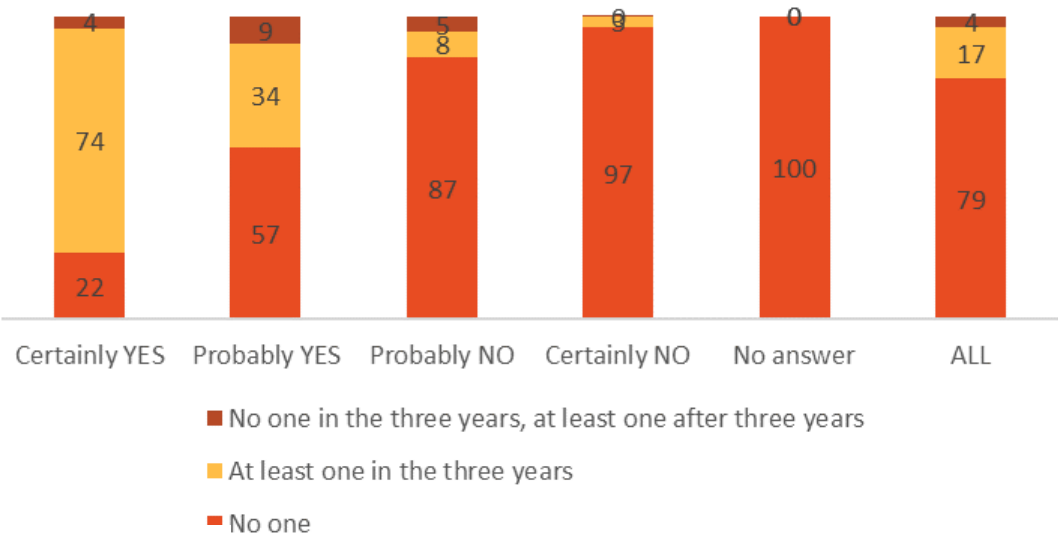

■ No one   ■ At least one in the three years

# Fertility realization by Parity

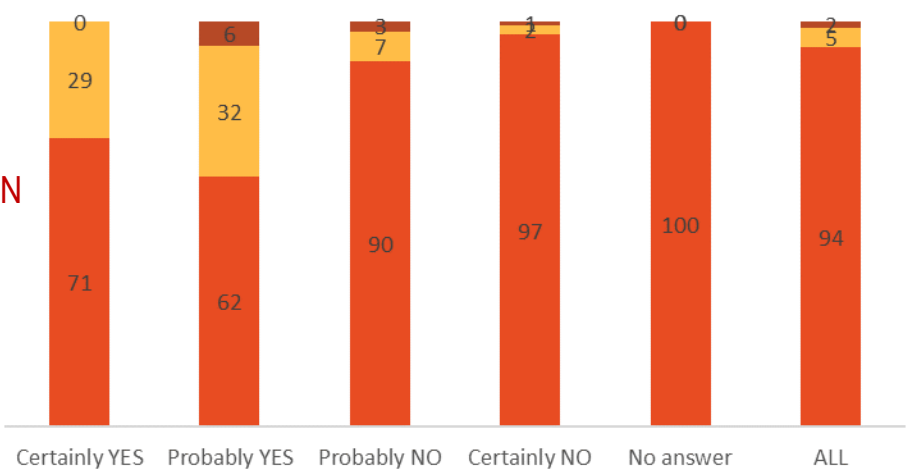

CHILDLESS

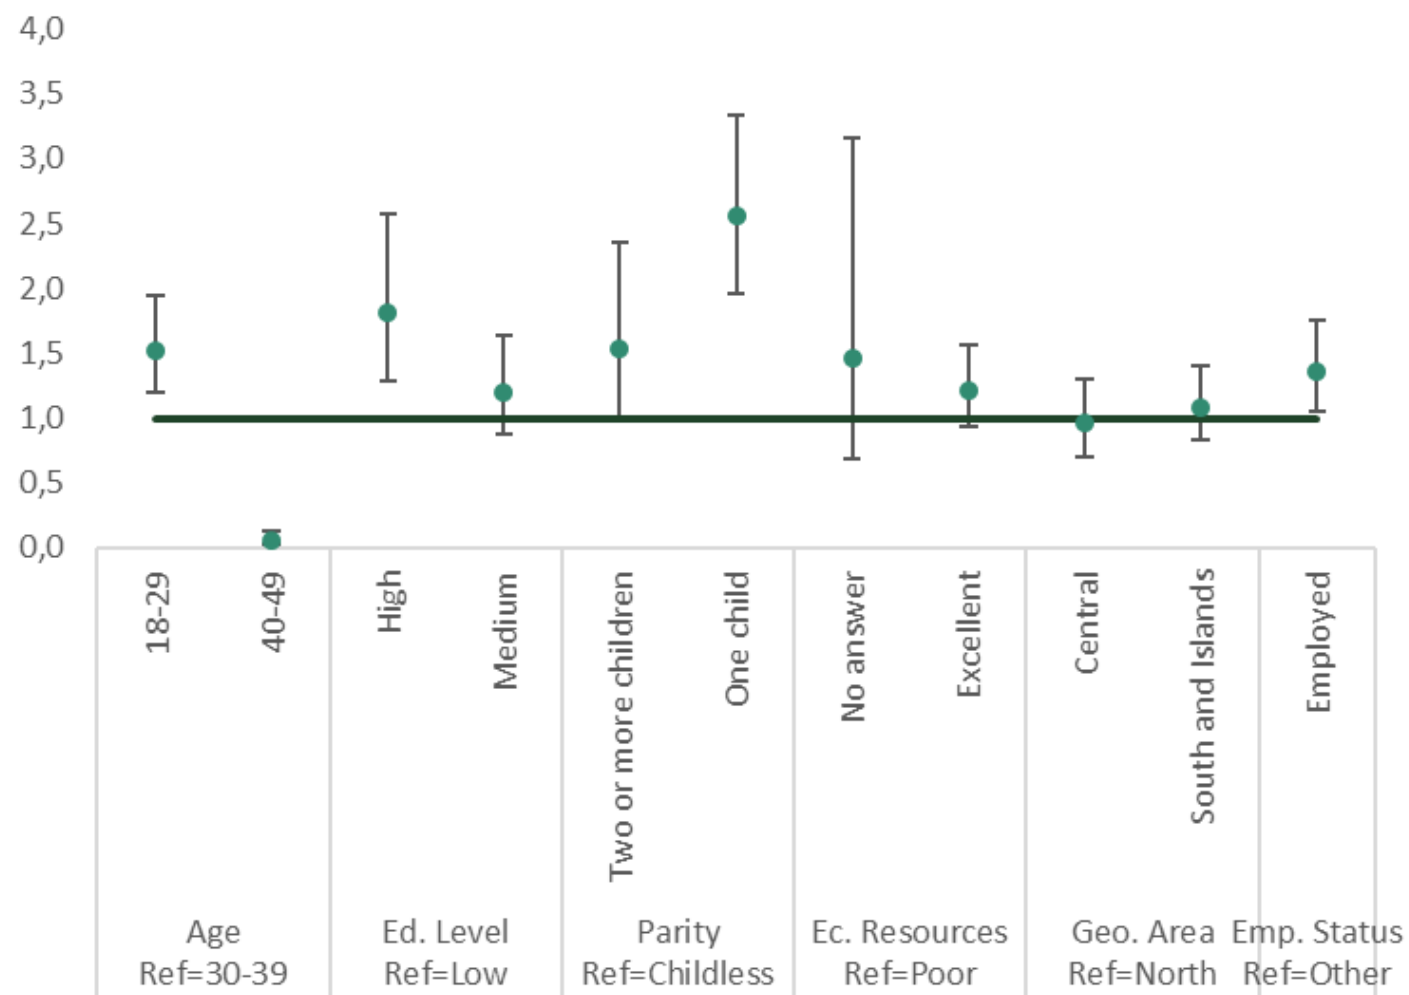

ONE CHILD

TWO OR MORE CHILDREN

# What Predicts Realization? Insights from the Logistic Model

# Conclusions and further steps

---

1. There is a persistent and **growing gap** between how many children people say they want—and how many they actually have.
  2. Italy exhibits a unique pattern of **postponed** and **unrealized** fertility, particularly among younger cohorts.
  3. Thanks to this new longitudinal register, we now have the tools to investigate this phenomenon **in depth**, and **over time**.
- Looking forward, we aim to expand the dataset, refine our models, and translate our findings into actionable recommendations for policymakers. If we want to support people in achieving their fertility aspirations, we need more responsive social policies that address the real obstacles they face.
